

1.Static: microampere level, almost no power consumption

2. Working current: About 10mA, dissipated power about 120mW

3. Press K1 + K2 to clear the data and K2 + K3 to restore the data

4. When copying, press K1, K2, K3 and K4 of the copy remote control and the original remote control at the same time to copy the data respectively. When in use, the key data of k1-k4 modulates the 433.92mhz high-frequency wave generated by the crystal and triode related circuit through the pulse width data output by the chip, radiates it through the transmitting antenna, and the receiving end performs corresponding functions after receiving and demodulating

FCC Warning:

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Any Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation
