2. DESCRIPTION OF THE DEVICE UNDER TEST (DUT)

The device is a second-generation Main Unit for the PERI InSite Construction Data Acquisition System that has a wide range of connection capabilities. It can connect to the Cloud based services using cable-based Ethernet or wireless uplink using LTE-M1/NB-IoT or WiFi.

Data is transmitted via radio from the Application Brick to the Hub which in turn displays the data on the screen so that the operator can monitor the concreting process. The Hub also acts as an uplink to the web portal on the Internet where the data is stored for future reference.

Cellular and WLAN antennas are located inside the handle, thus the handle part of the DUT was detached and used in SAR testing. Photos of the exact antenna location and test positions are presented in Appendix A.

2.2 SAR Test Exclusions

2.2.1 Excluded Bands from Testing

According to April 2015 TCB workshop, SAR test exclusion can be applied for testing overlapping LTE bands when the specified maximum output power, including tune-up tolerance, is less or same for the smaller band as for the larger band. The channel bandwidth and other operating parameters for the smaller band must be fully supported by the larger band.

For this product:

- LTE-M1 2 band, 1850-1910 MHz, is excluded from the testing as it is fully covered by LTE-M1 25 band, 1850-1915 MHz
- LTE-M1 4 band, 1710-1755 MHz, is excluded from the testing as it is fully covered by LTE-M1 66 band, 1710-1780 MHz
- LTE-M1 5 band, 824-849 MHz is excluded as it is fully covered by LTE-M1 26 band, 814-849 MHz
- NB-IoT 4 band, 1710-1755 MHz, is excluded from the testing as it is fully covered by LTE-M1 66 band, 1710-1780 MHz

2.3 Simultaneous Transmission

LTE-M1 or NB-IoT and WLAN 2.4GHz can be operated simultaneously.

Possible simultaneous transmissions are:

LTE-M1 & WLAN 2.4GHz

NB-IoT & WLAN 2.4GHz

4. TEST EQUIPMENT

Dasy52 near field scanning systems, manufactured by SPEAG were used for SAR testing. The test system consists of high precision robotics system (Staubli), robot controller, computer, near-field probe, probe alignment sensor, and a phantom containing the tissue equivalent material. The robot is a six-axis industrial robot performing precise movements to position the probe to the location of maximum electromagnetic field.

Construction	Symmetrical design with triangular core Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., DGBE)
Calibration	Calibration certificate in Appendix D
Frequency	10 MHz to >6 GHz (dosimetry); Linearity: ± 0.2 dB (30 MHz to 6 GHz)
Directivity	± 0.3 dB in HSL (rotation around probe axis) ± 0.5 dB in tissue material (rotation normal to probe axis)
Dynamic Range	10 μ W/g to > 100 mW/g, Linearity: ± 0.2 dB
Dimensions	Overall length: 330 mm Tip length: 10 mm Body diameter: 12 mm Tip diameter: 2.5 mm Distance from probe tip to dipole centers: 1.0 mm
Application	General dosimetry up to 6 GHz Compliance tests of mobile phones Fast automatic scanning in arbitrary phantoms

4.2 Phantoms

The Triple Modular Phantom consists of three identical modules that can be installed and removed separately without emptying the liquid. It is used for compliance testing of small wireless devices in body-worn configurations. The phantom conforms to the requirements of IEEE 1528 and FCC published RF Exposure KDB Procedures. The shell thickness of the bottom plate is 2 ± 0.2 mm. The dimensions are 308x192x182 mm and filling volume is 9.2 liters giving a filling height of 155 mm.

4.3 Tissue Simulants

Recommended values for the dielectric parameters of the tissue simulants are given in IEEE 1528 and FCC published RF Exposure KDB Procedures. The dielectric parameters of the used tissue simulants were within $\pm 10\%$ of the recommended values in all frequencies used. A liquid compensation algorithm was used in DASY5 with which measured peak average SAR values were corrected for the deviation of used liquid. Depth of the tissue simulant was at least 15.0 cm from the inner surface of the flat phantom.

5. TEST PROCEDURE

Testing was carried out in accordance with FCC KDB Publications 447498 D01 and Industry Canada RSS-102. KDB 941225 D05 was used to select LTE-M1 and NB-IoT test modes for SAR testing. Since the antennas are located inside the handle of the device, the handle part of the DUT was detached and used in SAR testing.

The DUT was set to transmit with full power by using communication tester for cellular technologies.

According to the customer, the maximum operation duty cycle of the DUT is 50%. For LTE-M1 was measured with 30% duty cycle and was scaled up to 50%. NB-IoT was measured with 33% duty cycle and was scaled up to 50%.

A control software was used for WLAN to set the DUT to transmit at maximum power.

The WLAN transmission modes for testing were selected according to power, largest channel bandwidth configuration, lowest order modulation and lowest data rate. 2.4GHz WLAN was tested with 802.11b standard with data rate of 1Mbit/s.

5.1 Device Holder

The device was placed in the device holder (illustrated below) that is supplied by SPEAG as an integral part of the Dasy system.

Device holder supplied by SPEAG

5.2 Test Positions

5.2.1 Extremity/Body-worn Configuration, 0mm separation distance

The device was placed on the SPEAG holder and lifted towards the phantom until the distance between the phantom and the device was 0mm. Five sides of the device were tested. Front, Left and Right sides were measured for Limb SAR. Back and bottom sides were measured for Body SAR as the DUT may be held in lap.

Photos of the test positions are presented in appendix A.

5.3 Scan Procedures

First, area scans were used for determination of the field distribution. Next, a zoom scan was performed around the highest E-field value to determine the averaged SAR value. Power drift was determined by measuring the same point at the start of the area scan and again at the end of the zoom scan.

5.4 SAR Averaging Methods

The maximum SAR value was averaged over a cube of tissue using interpolation and extrapolation.

The interpolation, extrapolation and maximum search routines within Dasy52 are all based on the modified Quadratic Shepard's method (Robert J. Renka, "Multivariate Interpolation of Large Sets of Scattered Data", University of North Texas ACM Transactions on Mathematical Software, vol. 14, no. 2, June 1988, pp. 139-148).

The interpolation scheme combines a least-square fitted function method with a weighted average method. A trivariate 3-D / bivariate 2-D quadratic function is computed for each measurement point and fitted to neighboring points by a least-square method. For the zoom scan, inverse distance weighting is incorporated to fit distant points more accurately. The interpolating function is finally calculated as a weighted average of the quadratics.

In the zoom scan, the interpolation function is used to extrapolate the Peak SAR from the deepest measurement points to the inner surface of the phantom.

7.3 IEC 62209-2 AMD1:2019

According to IEC 62209-2 AMD1:2019, the zoom scan complies if the peak spatial-average SAR is below 0.1 W/kg, or if the following criteria is met:

1. The smallest horizontal distance from the local SAR peaks to all points 3 dB below the SAR peak is larger than the horizontal grid step.
2. Ratio of SAR at the second measured point (M2) to the SAR at the closest measured point (M1) at the x-y location of the measured maximum is at least 30%.

Zoom scan compliance according to IEC 62209-2 AMD1:2019 is automatically verified by DASY5 software and all zoom scans in this test report do pass the criteria. The smallest horizontal distance and Ratio between measurement points M2 and M1 of the highest SAR results is available in Appendix C.
