

## TEST REPORT

Test report no.: 1-4031/22-01-02-A

### Testing laboratory

**CTC advanced GmbH**

Untertuerkheimer Strasse 6 – 10

66117 Saarbruecken / Germany

Phone: + 49 681 5 98 - 0

Fax: + 49 681 5 98 - 9075

Internet: <https://www.ctcadvanced.com>

e-mail: [mail@ctcadvanced.com](mailto:mail@ctcadvanced.com)

**Accredited Testing Laboratory:**

The testing laboratory (area of testing) is accredited according to DIN EN ISO/IEC 17025 (2018-03) by the Deutsche Akkreditierungsstelle GmbH (DAkkS)

The accreditation is valid for the scope of testing procedures as stated in the accreditation certificate starting with the registration number: D-PL-12076-01.

### Applicant

**STILL GmbH**

Berzeliusstr. 10

22113 Hamburg / GERMANY

Phone: +49 231 700996 10

Fax: +49 231 700996 14

Contact: Volker Köster

e-mail: [koester@comnovo.de](mailto:koester@comnovo.de)

### Manufacturer

**Comnovo GmbH**

Emil-Figge-Str. 76

44227 Dortmund / GERMANY

### Test standard/s

FCC - Title 47 CFR Part 15      FCC - Title 47 of the Code of Federal Regulations; Chapter I; Part 15 - Radio frequency devices

RSS - 220 Issue 1,      Spectrum Management and Telecommunications Radio Standards  
amendment 1      Specification - Devices Using Ultra-Wideband (UWB) Technology

For further applied test standards please refer to section 3 of this test report.

### Test Item

**Kind of test item:**      Portable UWB device for iGo Neo system

**Model name:**      Remote Control

**FCC ID:**      2A6WM7918920008

**IC:**      28586-7918920008

**Frequency:**      3100 MHz to 10600 MHz

**Technology tested:**      UWB

**Antenna:**      Integrated antenna

**Power supply:**      3.7 V DC by battery

**Temperature range:**      -20°C to +45°C

This test report is electronically signed and valid without handwritten signature. For verification of the electronic signatures, the public keys can be requested at the testing laboratory.

### Test report authorized:

Thomas Vogler  
Lab Manager

### Test performed:

p.o.  
Frank Heussner  
Testing Manager

## 2 General information

### 2.1 Notes and disclaimer

The test results of this test report relate exclusively to the test item specified in this test report. CTC advanced GmbH does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item.

The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of CTC advanced GmbH.

The testing service provided by CTC advanced GmbH has been rendered under the current "General Terms and Conditions for CTC advanced GmbH".

CTC advanced GmbH will not be liable for any loss or damage resulting from false, inaccurate, inappropriate or incomplete product information provided by the customer.

Under no circumstances does the CTC advanced GmbH test report include any endorsement or warranty regarding the functionality, quality or performance of any other product or service provided.

Under no circumstances does the CTC advanced GmbH test report include or imply any product or service warranties from CTC advanced GmbH, including, without limitation, any implied warranties of merchantability, fitness for purpose, or non-infringement, all of which are expressly disclaimed by CTC advanced GmbH.

All rights and remedies regarding vendor's products and services for which CTC advanced GmbH has prepared this test report shall be provided by the party offering such products or services and not by CTC advanced GmbH. In no case this test report can be considered as a Letter of Approval.

This test report is electronically signed and valid without handwritten signature. For verification of the electronic signatures, the public keys can be requested at the testing laboratory.

### 2.2 Application details

#### 4 Reporting statements of conformity – decision rule

Only the measured values related to their corresponding limits will be used to decide whether the equipment under test meets the requirements of the test standards listed in chapter 3.

The measurement uncertainty is mentioned in this test report, see chapter 9, but is not taken into account - neither to the limits nor to the measurement results. Measurement results with a smaller margin to the corresponding limits than the measurement uncertainty have a potential risk of more than 5% that the decision might be wrong.

measured value, measurement uncertainty, verdict

All critical final measurements are performed with 3.7 V DC by battery. |

## 6 Test item

### 6.1 General description

|                              |  |
|------------------------------|--|
| Kind of test item :          | Portable UWB device for iGo Neo system         |
| Model name :                 | Remote Control                                 |
| HMN :                        | -/-  |
| PMN :                        | Remote Control                                 |
| HVIN :                       | Remote Control                                 |
| FVIN :                       | -/-  |
| S/N serial number :          | EUT1: B7-011114-46/20<br>EUT2: B7-011162-08/22 |
| Power setting :              | 20 dB image                                    |
| Hardware status :            | EUT1: 1.01<br>EUT2: 3.00                       |
| Software status :            | EUT1: 2.06<br>EUT2: 2.00                       |
| Frequency band :             | 3100 MHz to 10600 MHz (UWB Channel 5)          |
| Type of radio transmission : | Pulse  |
| Use of frequency spectrum :  |  |
| Type of modulation :         | BPSK / BPM                                     |
| Number of channels :         | 1 (UWB Channel 5)                              |
| Antenna :                    | Integrated antenna                             |
| Power supply :               | 3.7 V DC by battery                            |
| Temperature range :          | -20°C to +45°C                                 |

Note: Hardware and software status

- As declared by the customer, both products are exactly the same and only the model names/versions differ. This means that the regarding hardware platforms are exactly the same. In addition, the applied software variants of the mentioned platforms utilize the same RF- settings as the source platforms.
- Reference document: *Equality of hardware platforms\_Remote Control.pdf*

## 6.2 Additional information

The content of the following annexes is defined in the QA. It may be that not all of the listed annexes are necessary for this report, thus some values in between may be missing.

Test setup and EUT photos are included in test report:

- 1-4031/22-01-01\_AnnexA
- 1-4031/22-01-01\_AnnexB
- 1-4031/22-01-01\_AnnexD

## 7 Description of the test setup

Typically, the calibrations of the test apparatus are commissioned to and performed by an accredited calibration laboratory. The calibration intervals are determined in accordance with the DIN EN ISO/IEC 17025. In addition to the external calibrations, the laboratory executes comparison measurements with other calibrated test systems or effective verifications. Weekly chamber inspections and range calibrations are performed. Where possible, RF generating and signaling equipment as well as measuring receivers and analyzers are connected to an external high-precision 10 MHz reference (GPS-based or rubidium frequency standard).

In order to simplify the identification of the equipment used at some special tests, some items of test equipment and ancillaries can be provided with an identifier or number in the equipment list below (Lab/Item).

### **Agenda:** Kind of Calibration

|      |  |     |  |
|------|--|-----|--|
| k    | calibration / calibrated                   | EK  | limited calibration                                  |
| ne   | not required (k, ev, izw, zw not required) | zw  | cyclical maintenance (external cyclical maintenance) |
| ev   | periodic self verification                 | izw | internal cyclical maintenance                        |
| Ve   | long-term stability recognized             | g   | blocked for accredited testing                       |
| vlk! | Attention: extended calibration interval   |     |  |
| NK!  | Attention: not calibrated                  | *)  | next calibration ordered / currently in progress     |

## 7.1 Shielded semi anechoic chamber

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 30 MHz to 1 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas are conform to specifications ANSI C63. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test setups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received. The wanted and unwanted emissions are received by spectrum analyzers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.

Measurement distance: tri-log antenna 10 meter

$$FS = UR + CL + AF$$

(FS-field strength; UR-voltage at the receiver; CL-loss of the cable; AF-antenna factor)

Example calculation:

$$FS \text{ [dB}\mu\text{V/m]} = 12.35 \text{ [dB}\mu\text{V/m]} + 1.90 \text{ [dB]} + 16.80 \text{ [dB/m]} = 31.05 \text{ [dB}\mu\text{V/m]} \text{ (35.69 } \mu\text{V/m)}$$

## 7.2 Shielded fully anechoic chamber

Measurement distance: loop antenna and horn antenna 3 meter;

$$FS = UR + CA + AF$$

(FS-field strength; UR-voltage at the receiver; CA-loss of the signal path; AF-antenna factor)

Example calculation:

$$FS \text{ [dB}\mu\text{V/m]} = 40.0 \text{ [dB}\mu\text{V/m]} + (-35.8) \text{ [dB]} + 32.9 \text{ [dB/m]} = 37.1 \text{ [dB}\mu\text{V/m]} \text{ (71.61 } \mu\text{V/m)}$$

$$OP = AV + D - G + CA$$

(OP-radiated output power; AV-analyzer value; D-free field attenuation of measurement distance;  
 G-antenna gain+amplifier gain; CA-loss signal path)

Example calculation:

$$OP \text{ [dBm]} = -65.0 \text{ [dBm]} + 50 \text{ [dB]} - 20 \text{ [dBi]} + 5 \text{ [dB]} = -30 \text{ [dBm]} \text{ (1 } \mu\text{W)}$$

**Equipment table (Chamber C):**

### 7.3 Radiated measurements > 18 GHz

Measurement distance: horn antenna e.g. 75 cm

$$FS = UR + CA + AF$$

(FS-field strength; UR-voltage at the receiver; CA-loss signal path & distance correction; AF-antenna factor)

Example calculation:

$$FS \text{ [dB}\mu\text{V/m]} = 40.0 \text{ [dB}\mu\text{V/m]} + (-60.1) \text{ [dB]} + 36.74 \text{ [dB/m]} = 16.64 \text{ [dB}\mu\text{V/m]} \text{ (6.79 } \mu\text{V/m)}$$

$$OP = AV + D - G + CA$$

(OP-radiated output power; AV-analyzer value; D-free field attenuation of measurement distance; G-antenna gain+amplifier gain; CA-loss signal path)

Example calculation:

$$OP \text{ [dBm]} = -59.0 \text{ [dBm]} + 44.0 \text{ [dB]} - 20.0 \text{ [dBi]} + 5.0 \text{ [dB]} = -30 \text{ [dBm]} \text{ (1 } \mu\text{W)}$$

Note: conversion loss of mixer is already included in analyzer value.

## 8 Sequence of testing

### 8.1 Sequence of testing radiated spurious 9 kHz to 30 MHz

#### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, it is placed on a table with 0.8 m height.
- If the EUT is a floor standing device, it is placed directly on the turn table.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 3 m (see ANSI C 63.4) – see test details.
- EUT is set into operation.

#### Premeasurement\*

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna height is 1 m.
- At each turntable position the analyzer sweeps with positive-peak detector to find the maximum of all emissions.

#### Final measurement

- Identified emissions during the pre-measurement are maximized by the software by rotating the turntable from 0° to 360°.
- Loop antenna is rotated about its vertical axis for maximum response at each azimuth about the EUT. (For certain applications, the loop antenna plane may also need to be positioned horizontally at the specified distance from the EUT)
- The final measurement is done in the position (turntable and elevation) causing the highest emissions with quasi-peak (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, turntable position, correction factor, margin to the limit and limit will be recorded. A plot with the graph of the premeasurement and the limit is stored.

\*Note: The sequence will be repeated three times with different EUT orientations.

## 8.2 Sequence of testing radiated spurious 30 MHz to 1 GHz

### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, a table with 0.8 m height is used, which is placed on the ground plane.
- If the EUT is a floor standing device, it is placed on the ground plane with insulation between both.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 10 m or 3 m (see ANSI C 63.4) – see test details.
- EUT is set into operation.

### Premeasurement

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna is polarized vertical and horizontal.
- The antenna height changes from 1 m to 3 m.
- At each turntable position, antenna polarization and height the analyzer sweeps three times in peak to find the maximum of all emissions.

### Final measurement

- The final measurement is performed for at least six highest peaks according to the requirements of the ANSI C63.4.
- Based on antenna and turntable positions at which the peak values are measured the software maximize the peaks by changing turntable position  $\pm 45^\circ$  and antenna height between 1 and 4 m.
- The final measurement is done with quasi-peak detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, antenna height, antenna polarization, turntable angle, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement with marked maximum final results and the limit is stored.

### 8.3 Sequence of testing radiated spurious 1 GHz to 18 GHz

#### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, a 2-axis positioner with 1.5 m height is used.
- If the EUT is a floor standing device, it is placed directly on the turn table.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 3 m (see ANSI C 63.4) – see test details.
- EUT is set into operation.

#### Premeasurement

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna is polarized vertical and horizontal.
- The antenna height is 1.5 m.
- At each turntable position and antenna polarization the analyzer sweeps with positive peak detector to find the maximum of all emissions.

#### Final measurement

- The final measurement is performed for at least six highest peaks according to the requirements of the ANSI C63.4.
- Based on antenna and turntable positions at which the peak values are measured the software maximizes the peaks by rotating the turntable from 0° to 360°. This measurement is repeated for different EUT-table positions (0° to 150° in 30°-steps) and for both antenna polarizations.
- The final measurement is done in the position (turntable, EUT-table and antenna polarization) causing the highest emissions with Peak and RMS detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, turntable position, EUT-table position, antenna polarization, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement with marked maximum final results and the limit is stored.

## 8.4 Sequence of testing radiated spurious above 18 GHz

### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet.
- The measurement distance is as appropriate (e.g. 0.5 m).
- The EUT is set into operation.

### Premeasurement

- The test antenna is handheld and moved carefully over the EUT to cover the EUT's whole sphere and different polarizations of the antenna.

### Final measurement

- The final measurement is performed at the position and antenna orientation causing the highest emissions with Peak and RMS detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement and the limit is stored.

## 8.5 Sequence of testing efficient use of spectrum

### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- The EUT positioned at a distance of approx. 0.5m to the horn antenna used for the measurement.
- The associated receiver is positioned between the EUT the horn antenna to assure that the received signal level of the associated receiver at the spectrum analyzer is higher than the level of the EUT.

### Measurement:

- Switch on EUT and associated receiver and wait until the connection is established.
- Start Analyzer sweep in Zerospan with a sweep time of 15 s.
- Switch of the associated receiver.
- When switching of the associated receiver, a drop in the received signal level at the spectrum analyzer can be observed. → position marker 1
- Position marker two at the point where the transmission of the EUT stops.
- Measure time difference between marker 1 and marker 2.

## 9 Measurement uncertainty

| Test case  | Uncertainty   |
|--|---|
| Equivalent isotropically radiated power (e.i.r.p.)                 | Conducted value $\pm 1$ dB<br>Radiated value $\pm 3$ dB |
| Permitted range of operating frequencies                           | $\pm 100$ kHz   |
| Conducted unwanted emissions in the spurious domain (up to 18 GHz) | $\pm 1$ dB  |
| Radiated unwanted emissions in the spurious domain (up to 18 GHz)  | $\pm 3$ dB  |
| Conducted unwanted emissions in the spurious domain (18 to 40 GHz) | $\pm 4$ dB  |
| Radiated unwanted emissions in the spurious domain (18 to 40 GHz)  | $\pm 4$ dB  |
| Conducted unwanted emissions in the spurious domain (40 to 50 GHz) | $\pm 4.5$ dB  |
| Radiated unwanted emissions in the spurious domain (40 to 50 GHz)  | $\pm 4.5$ dB  |
| Conducted unwanted emissions in the spurious domain (above 50 GHz) | $\pm 5$ dB  |
| Radiated unwanted emissions in the spurious domain (above 50 GHz)  | $\pm 5$ dB  |
| DC and low frequency voltages                                      | $\pm 3$ %   |
| Temperature  | $\pm 1$ °C  |
| Humidity   | $\pm 3$ %   |

**Note:** NA = Not Applicable; NP = Not Performed

## 11 Additional comments

Data port in the radio terminal (RSS-220 3.2): no

Subclass of UWB device (RSS-220 3.2): Hand-held Communication Devices

Reference documents: *Equality of hardware platforms\_Remote Control.pdf* (see chapter 6)

Special test descriptions: None

Configuration descriptions: None

Test mode: ☐ No test mode available.  
☒ Special test mode/software is used.

Test device (EUT):

- EUT 1:
  - UWB emissions are turned on and the test mode described below is used. As requested by the customer, this sample and the corresponding results were used for test cases "fundamantel emission: RMS" and "fundamental emission: Max Peak" shown in chapter 12.2. All other measurements were performed using the test device mentioned below.
- EUT 2:
  - Test-Mode: UWB emissions are turned on and the test mode described below is used.
  - Normal Mode: UWB emissions are turned on and the normal mode (intended use) is used.

Description of test mode as declared by customer:

- UWB test mode:
  - Cycle time 1 ms
  - Remaining transmission parameters as in case of normal operation mode
  - Parameters (e.g. payload) selected so that the maximum average and peak output power is obtained

## 12 Measurement results

### 12.1 10 dB - Bandwidth

#### Description:

Measurement of the -10 dB bandwidth of the wanted signal.

#### **§15.503(a)**

*UWB bandwidth.* For the purpose of this subpart, the UWB bandwidth is the frequency band bounded by the points that are 10 dB below the highest radiated emission, as based on the complete transmission system including the antenna. The upper boundary is designated  $f_H$  and the lower boundary is designated  $f_L$ . The frequency at which the highest radiated emission occurs is designated  $f_M$ .

#### **§15.503(b)**

*Center frequency.* The center frequency,  $f_C$ , equals  $(f_H + f_L)/2$ .

#### **§15.503(c)**

*Fractional bandwidth.* The fractional bandwidth equals  $2(f_H - f_L) / (f_H + f_L)$ .

#### **RSS-220 Annex 2**

“-10 dB bandwidth  $B_{-10}$ ” and “-10 dB fractional bandwidth  $\mu_{-10}$ ” are defined as follows:

$$B_{-10} = f_H - f_L$$

$$\mu_{-10} = B_{-10}/f_C$$

where:

$f_M$  is the frequency of maximum UWB transmission;

$f_H$  is the highest frequency at which the power spectral density of the UWB transmission is -10 dB relative to  $f_M$ ;

$f_L$  is the lowest frequency at which the power spectral density of the UWB transmission is -10 dB relative to  $f_M$ ;

$f_C = (f_H + f_L)/2$  is the centre frequency of the -10 dB bandwidth.

#### Measurement:

| Measurement parameter |          |
|-----------------------|----------|
| Detector:             | Pos-Peak |
| Video bandwidth:      | 1 MHz    |
| Resolution bandwidth: | 3 MHz    |
| Trace-Mode:           | Max Hold |

**Limits:****§15.503(d)**

*Ultra-wideband (UWB) transmitter.* An intentional radiator that, at any point in time, has a fractional bandwidth equal to or greater than 0.20 or has a UWB bandwidth equal to or greater than 500 MHz, regardless of the fractional bandwidth.

**§15.519(b)**

The UWB bandwidth of a device operating under the provisions of this section must be contained between 3100 MHz and 10,600 MHz.

**RSS-220 2**

A UWB device is an intentional radiator that has either a -10 dB bandwidth of at least 500 MHz or a -10 dB fractional bandwidth greater than 0.2.

**RSS-220 5.1(a)**

The -10 dB bandwidth of the device shall be totally contained in the band 3.1-10.6 GHz.

Lower -10 dB point > 3.1 GHz  
 Upper -10 dB point < 10.6 GHz

-10 dB bandwidth  $\geq$  500 MHz  
 or  
 -10 dB fractional bandwidth > 0.2

**Results:**

| Lower -10 dB point [MHz] | Higher -10 dB point [MHz] | UWB bandwidth [MHz] | Plot |
|--------------------------|---------------------------|---------------------|------|
| 6152                     | 6827                      | 675                 | 1    |

**Verdict: Compliant**

**Plot 1: 10 dB bandwidth, UWB test mode (EUT2)**

## 12.2 TX Radiated Emissions

### Description:

Measurement of the radiated emissions in transmit mode.

### Measurement:

#### §15.209, RSS-220 3.4:

| Measurement parameter |            |
|-----------------------|------------|
| Detector:             | Peak/QPeak |
| Sweep time:           | 1 s        |
| Resolution bandwidth: | 120kHz     |
| Video bandwidth:      | ≥ RBW      |
| Trace-Mode:           | Max Hold   |

#### §15.519(c), RSS-220 5.3.1(d):

| Measurement parameter |          |
|-----------------------|----------|
| Detector:             | RMS      |
| Sweep time:           | 1 ms/pt  |
| Resolution bandwidth: | 1 MHz    |
| Video bandwidth:      | 3 MHz    |
| Trace-Mode:           | Max Hold |

#### §15.519(d), RSS-220 5.3.1(e):

| Measurement parameter |                 |
|-----------------------|-----------------|
| Detector:             | RMS             |
| Sweep time:           | 1 ms/pt         |
| Resolution bandwidth: | 30 kHz / 1 kHz  |
| Video bandwidth:      | 300 kHz / 3 kHz |
| Trace-Mode:           | Max Hold        |

#### §15.519(e), RSS-220 Annex 4(c):

| Measurement parameter |           |
|-----------------------|-----------|
| Detector:             | Pos-Peak  |
| Resolution bandwidth: | 50 MHz    |
| Video bandwidth:      | 80 MHz    |
| Span:                 | Zero span |
| Trace-Mode:           | Max Hold  |

**Limits:****Radiated emissions at or below 960 MHz (§15.209, RSS-220 3.4, RSS-Gen 8.9):**

| Frequency (MHz) | Field strength ( $\mu\text{V/m}$ ) | Measurement distance (m) |
|-----------------|------------------------------------|--------------------------|
| 0.009 – 0.490   | 2400/F(kHz)                        | 300                      |
| 0.490 – 1.705   | 24000/F(kHz)                       | 30                       |
| 1.705 – 30      | 30 (29.5 dB $\mu\text{V/m}$ )      | 30                       |
| 30 – 88         | 100 (40 dB $\mu\text{V/m}$ )       | 3                        |
| 88 – 216        | 150 (43.5 dB $\mu\text{V/m}$ )     | 3                        |
| 216 – 960       | 200 (46 dB $\mu\text{V/m}$ )       | 3                        |
| > 960           | 500 (54 dB $\mu\text{V/m}$ )       | 3                        |

**§15.519 (c)**

The radiated emissions at or below 960 MHz from a device operating under the provisions of this section shall not exceed the emission levels in §15.209.

The radiated emissions above 960 MHz from a device operating under the provisions of this section shall not exceed the following average limits based on measurements using a resolution bandwidth of 1 MHz:

| Frequency in MHz | EIRP in dBm |
|------------------|-------------|
| 960 to 1610      | -75.3       |
| 1610 to 1990     | -63.3       |
| 1990 to 3100     | -61.3       |
| 3100 to 10600    | -41.3       |
| Above 10600      | -61.3       |

**§15.519 (d)**

In addition to the radiated emission limits specified in the table in paragraph of §15.519 (c), UWB transmitters operating under the provisions of this section shall not exceed the following average limits when measured using a resolution bandwidth of no less than 1 kHz:

| Frequency in MHz | EIRP in dBm |
|------------------|-------------|
| 1164 to 1240     | -85.3       |
| 1559 to 1610     | -85.3       |

**§15.519 (e)**

There is a limit on the peak level of the emissions contained within a 50 MHz bandwidth centered on the frequency at which the highest radiated emission occurs,  $f_M$ . That limit is 0 dBm EIRP. It is acceptable to employ a different resolution bandwidth, and a correspondingly different peak emission limit, following the procedures described in §15.521.

Further provisions of CFR 47 Part 15 Subpart F:

**§15.521 (c)**

Emissions from digital circuitry used to enable the operation of the UWB transmitter shall comply with the limits in §15.209, rather than the limits specified in this subpart, provided it can be clearly demonstrated that those emissions from the UWB device are due solely to emissions from digital circuitry contained within the transmitter and that the emissions are not intended to be radiated from the transmitter's antenna. Emissions from associated digital devices, as defined in §15.3(k), e.g., emissions from digital circuitry used to control additional functions or capabilities other than the UWB transmission, are subject to the limits contained in Subpart B of this part.

**§15.521 (d)**

Within the tables in §§15.509, 15.511, 15.513, 15.515, 15.517, and 15.519, the tighter emission limit applies at the band edges. Radiated emission levels at and below 960 MHz are based on measurements employing a CISPR quasi-peak detector. Radiated emission levels above 960 MHz are based on RMS average measurements over a 1 MHz resolution bandwidth. The RMS average measurement is based on the use of a spectrum analyzer with a resolution bandwidth of 1 MHz, an RMS detector, and a 1 millisecond or less averaging time. Unless otherwise stated, if pulse gating is employed where the transmitter is quiescent for intervals that are long compared to the nominal pulse repetition interval, measurements shall be made with the pulse train gated on. Alternative measurement procedures may be considered by the Commission.

**§15.521(e)**

The frequency at which the highest radiated emission occurs,  $f_M$ , must be contained within the UWB bandwidth.

**§15.521(g)**

When a peak measurement is required, it is acceptable to use a resolution bandwidth other than the 50 MHz specified in this subpart. This resolution bandwidth shall not be lower than 1 MHz or greater than 50 MHz, and the measurement shall be centered on the frequency at which the highest radiated emission occurs,  $f_M$ . If a resolution bandwidth other than 50 MHz is employed, the peak EIRP limit shall be  $20 \log (RBW/50)$  dBm where RBW is the resolution bandwidth in megahertz that is employed. This may be converted to a peak field strength level at 3 meters using  $E(\text{dBuV/m}) = P(\text{dBm EIRP}) + 95.2$ . If RBW is greater than 3 MHz, the application for certification filed with the Commission must contain a detailed description of the test procedure, calibration of the test setup, and the instrumentation employed in the testing.

**§15.521(h)**

The highest frequency employed in §15.33 to determine the frequency range over which radiated measurements are made shall be based on the center frequency,  $f_c$ , unless a higher frequency is generated within the UWB device. For measuring emission levels, the spectrum shall be investigated from the lowest frequency generated in the UWB transmitter, without going below 9 kHz, up to the frequency range shown in §15.33(a) or up to  $f_c + 3/(\text{pulse width in seconds})$ , whichever is higher. There is no requirement to measure emissions beyond 40 GHz provided  $f_c$  is less than 10 GHz; beyond 100 GHz if  $f_c$  is at or above 10 GHz and below 30 GHz; or beyond 200 GHz if  $f_c$  is at or above 30 GHz.

Further provisions of RSS-220:

#### **RSS-220 5.3.1(d)**

Radiated emissions above 960 MHz from a device shall not exceed the following average limits when measured using a resolution bandwidth of 1 MHz.

| Frequency in MHz | EIRP in dBm |
|------------------|-------------|
| 960 to 1610      | -75.3       |
| 1610 to 4750     | -70.0       |
| 4750 to 10600    | -41.3       |
| Above 10600      | -61.3       |

#### **RSS-220 5.3.1(e)**

In addition to the limits specified in paragraph (d) of this section, radiated emissions shall not exceed the following average limits when measured using a resolution bandwidth greater than or equal to 1 kHz. The measurements shall demonstrate compliance with the stated limits at whatever resolution bandwidth is used.

| Frequency in MHz | EIRP in dBm |
|------------------|-------------|
| 1164 to 1240     | -85.3       |
| 1559 to 1610     | -85.3       |

#### **RSS-220 5.3.1(f)**

Within the tables in paragraphs (d) and (e) above, the tighter emission limit applies at the band edges.

#### **RSS-220 5.3.1(g)**

The peak level of the transmissions shall not exceed the peak equivalent of the average limit contained within any 50 MHz bandwidth, as defined in section 4 of the Annex.

#### **RSS-220 Annex 4(c)**

Peak measurements shall be made in addition to average measurements. Transmissions shall not exceed 0 dBm e.i.r.p. in any 50 MHz bandwidth when the average limit is -41.3 dBm/MHz. This is the equivalent peak limit as calculated by combining the 6 dB peak-to-average conversion with a resolution bandwidth (RBW) scaling factor of  $20 \log(1 \text{ MHz}/50 \text{ MHz})$ . Only the 50 MHz bandwidth, centred on the frequency  $f_M$  where the highest power occurs, needs to be measured to satisfy the peak requirements for all frequencies. A different resolution bandwidth and a correspondingly different peak limit may also be used, in which case the RBW may be set anywhere between 1 MHz and 50 MHz. The peak e.i.r.p. limit is then calculated as  $20 \log(\text{RBW}/50) \text{ dBm}$  where the RBW is in MHz. This may be converted to a peak field strength level at 3 metres using  $E(\text{dBuV/m}) = P(\text{e.i.r.p. (dBm)}) + 95.2$ . If the RBW is greater than 3 MHz, the application for certification shall contain a detailed description of the test procedure, the calibration of the test set-up and the instrumentation used in the testing.

#### **RSS-220 Annex 4(m)**

Emissions from digital circuitry (used only to enable the operation of the UWB transmitter and that does not control additional functions or capabilities) shall comply with the average and peak power limits applicable to the UWB transmitter. If it can be clearly demonstrated that an emission from a UWB transmitter is due solely to emissions from digital circuitry contained within the transmitter, and that the emission is not intended to be radiated from the transmitter's antenna, the limits for emissions from digital circuitry prescribed in RSS-Gen apply to that emission rather than the UWB limits.

**Results:**Measurements of the fundamental emission:

| EUT | Frequency [GHz] | Max e.i.r.p. [dBm/MHz] | Applicable limit [dBm/MHz] | Margin [dB] | Plot |
|-----|-----------------|------------------------|----------------------------|-------------|------|
|     |                 | average value          |                            |             |      |
| 1   | 6.4896          | -42.5                  | -41.3                      | 1.2         | 2    |

| EUT | Frequency [GHz] | Max e.i.r.p. [dBm/50 MHz] | Applicable limit [dBm/50 MHz] | Margin [dB] | Plot |

Note: Time-consuming prescans are performed with an external power supply of 5 V DC at the designated feed point agreed with the customer.

## 12.3 Efficient use of spectrum acc. to §15.519(a)(1)

### Description:

#### **§15.519(a)(1)**

A UWB device operating under the provisions of this section shall transmit only when it is sending information to an associated receiver. The UWB intentional radiator shall cease transmission within 10 seconds unless it receives an acknowledgement from the associated receiver that its transmission is being received. An acknowledgment of reception must continue to be received by the UWB intentional radiator at least every 10 seconds or the UWB device must cease transmitting.

#### **KDB 393764 D01 UWB FAQ v02r01 Answer 4**

An acknowledgement of reception must continue to be received by the UWB device at least once every 10 seconds, or else the device shall cease transmission of any information other than periodic signals for use in the establishment or re-establishment of a communications link with an associated receiver.

#### **RSS-220 5.3.1(b)**

The device is to transmit only when it is sending information to an associated receiver. The device shall cease transmission of information within 10 seconds unless it receives an acknowledgement from the associated receiver that its transmission is being received. An acknowledgment of reception must continue to be received by the UWB device at least every 10 seconds or the UWB device shall cease transmitting any information other than periodic signals used for the establishment or re-establishment of a communication link with an associated receiver.

### Measurement:

| Measurement parameter |          |
|-----------------------|----------|
| Detector:             | Pos-Peak |
| Resolution bandwidth: | 10 MHz   |
| Video bandwidth:      | 28 MHz   |
| Span                  | Zero     |

### Limits:

#### **§15.519(a)(1), KDB 393764, RSS-220 5.3.1(b)**

EUT shall cease transmission of information within 10 seconds unless it receives an acknowledgement from the associated receiver.

However, periodic signals used for the establishment or re-establishment of a communication link with an associated receiver may be transmitted.

**Results:****Plot 14: Emissions of the EUT, only at the beginning with associated receiver (normal mode)**

Vertical line V1 indicates the time when the associated receiver is switched off.

Vertical line V2 indicates 10 s after the associated receiver is switched off.

→ Approximately 5.4 seconds after the associated receiver is switched off, the EUT ceases transmission of information and only sends periodic signals used for the establishment or re-establishment of a communication link.

Plot 15: Emission of EUT without associated receiver (for comparison), normal mode

→ Signals are used for the establishment or re-establishment of a communication link.

**Verdict: Compliant**

## 12.4 Antenna requirements

### Description:

#### **§15.519(a)(2)**

The use of antennas mounted on outdoor structures, e.g., antennas mounted on the outside of a building or on a telephone pole, or any fixed outdoors infrastructure is prohibited. Antennas may be mounted only on the hand held UWB device.

#### **§15.521(b)**

Manufacturers and users are reminded of the provisions of §§15.203 and 15.204.

#### **RSS-220 5.1(b)**

The antenna of the UWB device shall be factory-installed and shall not be made modifiable by users.

#### **RSS-220 5.3.1(a)**

The device shall be designed so as to prevent its connection to antennas mounted on outdoor structures, e.g., antennas mounted on the outside of a building or on a telephone pole, or any fixed outdoors infrastructure.

### Results:

|                     |
|---------------------|
| Integrated antenna. |
|---------------------|

**Verdict: Compliant**

## 12.5 Conducted emissions < 30MHz

### Description:

Measurement of the conducted spurious emissions in transmit mode below 30 MHz. Both power lines, phase and neutral line, are measured. Found peaks are re-measured with average and quasi peak detection to show compliance to the limits.

### Measurement:

| Parameter             |  |
|-----------------------|--|
| Detector:             | Peak - Quasi Peak / Average                |
| Sweep time:           | Auto                                       |
| Video bandwidth:      | F < 150 kHz: 200 Hz<br>F > 150 kHz: 9 kHz  |
| Resolution bandwidth: | F < 150 kHz: 1 kHz<br>F > 150 kHz: 100 kHz |
| Span:                 | 9 kHz to 30 MHz                            |
| Trace-Mode:           | Max Hold                                   |

### Limits:

| FCC                                   |                   | IC             |  |
|---------------------------------------|-------------------|----------------|--|
| CFR Part 15.207(a)                    |                   | RSS-Gen 8.8    |  |
| Conducted Spurious Emissions < 30 MHz |                   |                |  |
| Frequency (MHz)                       | Quasi-Peak (dBμV) | Average (dBμV) |  |
| 0.15 – 0.5                            | 66 to 56*         | 56 to 46*      |  |
| 0.5 – 5                               | 56                | 46             |  |
| 5 – 30.0                              | 60                | 50             |  |

\*Decreases with the logarithm of the frequency

**§15.521(j)**

Responsible parties are reminded of the other standards and requirements cross referenced in §15.505, such as a limit on emissions conducted onto the AC power lines.

**§15.207(c)**

Measurements to demonstrate compliance with the conducted limits are not required for devices which only employ battery power for operation and which do not operate from the AC power lines or contain provisions for operation while connected to the AC power lines. Devices that include, or make provisions for, the use of battery chargers which permit operating while charging, AC adapters or battery eliminators or that connect to the AC power lines indirectly, obtaining their power through another device which is connected to the AC power lines, shall be tested to demonstrate compliance with the conducted limits.

**RSS-220 3.1**

RSS-220 shall be used in conjunction with RSS-Gen, General Requirements and Information for the Certification of Radiocommunication Equipment, for general specifications and information relevant to the equipment for which this standard applies.

**Results:**

DUT employs only battery power for operation.

**Verdict: Not applicable**
