Applicant Name & Address : Polygroup Limited(Macao Commercial Offshore)  
Avenida Xian Xing Hai,Centro Golden Dragon,11 Andar Macau

Sample Description  
Product : Christmas Tree Lighting  
Model No. : LxGxYxS (the first x=30-120; the second x=0-5; the third x=0100-2300)  
Note: "L" means that the low voltage. The first "x" indicates the size of the tree, said the use of height from 3ft-12ft. "Gx" number of lines, G0 represents 0 drag line G5 on behalf of 5 drag line. "Y" means tree stand. M means the tree is to use ordinary tree foot. R which means that the tree is to use rotating tree foot. The third "x" represents the number of lamp, from 100 to 2300 lamp. "S" means that the tree pin.

Electrical Rating : Christmas Tree Lighting powered by Adapter .(Details in page 4 and 5)  
FCC ID : 2AABT-CW003

Date Received : 22 April 2013 & 21 April 2014  
Date Test Conducted : 25 April 2013-13 May 2013 & 21 April 2014-30 April 2014

Test standards : FCC Part 15: 2013 Subpart B  
Test Result : Pass  
Conclusion : The submitted samples complied with the above rules/standards.

Remark : None.

### Test Results Conclusion (with Justification)

RE: EMC Testing Pursuant to FCC Part 15, Subpart B Performed On the Christmas Tree Lighting, Model: LxGxYxS(the first x=30-120, means the height of the tree; the second x=0-5 ,means the number of the cord set; the third x=0100-2300, means the number of LED).

We tested the Christmas Tree Lighting, Model: L12G5R1400S, L12G5R2000S, L12G5R2300S, to determine if they were in compliance with the relevant FCC rules as marked on the Test Results Summary. We found that the units met the requirement of FCC Part 15, Subpart B when tested as received. The worst case's test data was presented in this test report.

The Equipment Under Test (EUT) is controlled by a controller, the controller is an intentional radiator using 433.92MHz frequency.

Antenna Type: PCB antenna.

The controller option of this receiver is subject to Certification procedure.

All models can use adapter and the controller PDR-001-29V series, PDR-002-29V series, PDR-003-29V series and with Remote Control PDT-001-29V.

The controllers PDR-001-29V, PDR-002-29V, PDR-003-29V are identical except the model number.

Adapter XY-2900100UO and XY-2900200UO they have the same circuit and mechanical design, their difference is that the output current and output electronic components parameters.

Adapter XY-2900300U, XY-2900300UO, XY-2900400U and XY-2900400UO they have the same circuit and mechanical design, their different is that the output current and output electronic components parameters.

Adapter TS-8W29V, TS-13W29V, TS-3W28V they have the same circuit and mechanical design, their different is that the output current and output electronic components parameters.

Adapter MTS810-29V and MTS-810-29V are all identical except the model number.

All models are declared to be identical in terms of electrical design, their difference lies in the number of LED. All models have been pre-tested and found L12G5R2000S+XY-2900800-U, L12G5R2300S+TS-29V0.9A, L12G5R1400S + MTS-810-29V were the worst case in all models.

The data on the below test result table lists the significant emission frequencies, the limit and the margin of compliance. Numbers with a minus sign are below the limit.

According 15.107, the worst case conducted emission at 0.452MHz

Judgement: Passed by -4.0 dB

According 15.109, the worst case radiated emission at 57.16 MHz

Judgement: Passed by -3.06 dB

The production units are required to conform to the initial sample as received when the units are placed on the market.

<b>Condition of Environment:</b>	Temperature : 22~28°C Relative Humidity: 35~60% Atmosphere Pressure 86~106kPa

#### Notes:

The EMI measurements had been made in the operating mode producing the largest emission in the frequency band being investigated consistent with normal applications.

An attempt had been made to maximize the emission by varying the configuration of the EUT.

## 4 TEST RESULTS

### 4.1 Conducted Disturbance Voltage at mains ports

**Test Result: Pass**

#### 4.1.1 Used Test Equipment

Equipment No.	Equipment	Model	Manufacturer
EM004-04	EMC shield Room	8m×3m×3m	Zhongyu
EM080-05	EMI receiver	ESCI	R&S
EM006-05	LISN	ENV216	R&S

#### 4.1.2 Block Diagram of Test Setup

#### 4.1.3 Test Setup and Procedure

Test was performed according to ANSI C63.4: 2009. The EUT was set to achieve the maximum emission level. The mains terminal disturbance voltage was measured with the EUT in a shielded room. The EUT was connected to AC power source through an Artificial Mains Network which provides a 50Ω linear impedance. Artificial hand is used if appropriate (for handheld apparatus). The load/control terminal disturbance voltage was measured with passive voltage probe if appropriate.

The table-top EUT was placed on a 0.8m high non-metallic table above earthed ground plane (Ground Reference Plane). And for floor standing EUT, was placed on a 0.1m high non-metallic supported on GRP. The EUT keeps a distance of at least 0.8m from any other of the metallic surface. The Artificial Mains Network is situated at a distance of 0.8m from the EUT.

During the test, mains lead of EUT excess 0.8m was folded back and forth parallel to the lead so as to form a horizontal bundle with a length between 0.3m and 0.4m.

The bandwidth of test receiver was set at 9 kHz. The frequency range from 150 kHz to 30MHz was checked.

#### 4.1.4 Limit

Class B

Frequency range MHz	AC mains terminals dB (uV)	
	Quasi-peak	Average
0.15 to 0.5	66 to 56	56 to 46
0.5 to 5	56	46
5 to 30	60	50
Note 1: The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.5 MHz.		
Note 2: The lower limit is applicable at the transition frequency.

### 4.2.2 Block Diagram of Test Setup

#### 4.2.3 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any), Average Factor (optional) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

→  $FS = RA + \text{Correct Factor}$

where FS = Field Strength in dB $\mu$ V/m

RA = Receiver Amplitude (including preamplifier) in dB $\mu$ V

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB

AG = Amplifier Gain in dB

Correct Factor = AF + CF – AG

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows:

$$FS = RA + \text{Correct Factor}$$

#### 4.2.4 Test Setup and Procedure

The measurement was applied in a 3 m semi-anechoic chamber. The EUT and simulators were placed on a 0.8m high wooden turntable above the horizontal metal ground plane. The turn table rotated 360 degrees to determine the position of the maximum emission level. The EUT was set 3 meters away from the receiving antenna which was mounted on an antenna mask. The antenna moved up and down between from 1meter to 4 meters to find out the maximum emission level.

Broadband antenna was used as receiving antenna. Both horizontal and vertical polarization of the antenna was set on measurement. In order to find the maximum emission, all of the interface cables were manipulated according to ANSI C63.4: 2009 requirement during radiated test. The bandwidth setting on R&S Test Receiver was 120 kHz for 30MHz-1GHz. The bandwidth setting on R&S Test Receiver was 1 MHz for above 1GHz.

Radiated emissions from an ITE shall be measured from the lowest frequency generated, or used, in the device or 30 MHz, whichever is higher, up to the frequency determined in accordance with Table following:

##### Frequency Range of Measurement

Highest Frequency Generated or Used in Device	Upper Frequency of Radiated Measurement
Below 1.705 MHz	30
1.705 MHz – 108 MHz	1 GHz
108 MHz – 500 MHz	2 GHz
500 MHz – 1 GHz	5 GHz
Above 1 GHz	5th harmonic of the highest frequency or 40 GHz, whichever is lower.
At transitional frequencies the lower limit applies.	

The frequency range from 30MHz to 2000MHz was checked.

#### 4.2.5 Limit

Radiated emissions from an unintentional radiator, including a digital device shall be measured from the lowest frequency generated, or used, in the device or 30 MHz, whichever is higher, up to the frequency determined in accordance with Table following:

Class B limit at 3m test distance:

Frequency range MHz	Field strength dB (μV/m)
30 to 88	40.0
88 to 216	43.5
216 to 960	46.0
Above 960	54.0
At transitional frequencies the lower limit applies.

Notes: 1. Quasi-peak detector was used at below 1GHz, peak detector was used at above 1GHz.

2. All measurements were made at 3 meter.

3. Negative value in the margin column shows emission below limit.

4. When tested above 1GHz, the emissions found were at least 20 dB below the limit.
