## 1. ATTESTATION OF TEST RESULTS

**COMPANY NAME:** CBF NETWORKS, INC., DBA FASTBACK NETWORKS  
2460 N. FIRST STREET, SUITE 200  
SAN JOSE, CA 95131, USA

**EUT DESCRIPTION:** INTELLIGENT BACKHAUL RADIO

**MODELS:** IBR-1300-NA and IBR-1301-NA

**SERIAL NUMBER:** Proto 1

**DATE TESTED:** January 15, 2016 – February 5, 2016

APPLICABLE STANDARDS	
STANDARD	TEST RESULTS
CFR 47 Part 15 Subpart E	Pass

UL Verification Services Inc. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL Verification Services Inc. based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

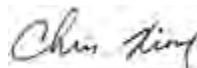

**Note:** The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL Verification Services Inc. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL Verification Services Inc. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, any agency of the Federal Government, or any agency of any government.

Approved & Released For  
UL Verification Services Inc. By:

FRANCISCO DE ANDA  
PROGRAM MANAGER  
UL Verification Services Inc.

Tested By:

CHRIS XIONG  
EMC ENGINEER  
UL Verification Services Inc.

## 2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with FCC CFR 47 Part 2, FCC CFR 47 Part 15, ANSI C63.10-2013, FCC KDB 789033, FCC KDB 662911 and FCC 06-96.

## 3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 47173 and 47266 Benicia Street, Fremont, California, USA. Line conducted emissions are measured only at the 47173 address. The following table identifies which facilities were utilized for radiated emission measurements documented in this report. Specific facilities are also identified in the test results sections.

47173 Benicia Street	47266 Benicia Street
<input type="checkbox"/> Chamber A	<input type="checkbox"/> Chamber D
<input type="checkbox"/> Chamber B	<input type="checkbox"/> Chamber E
<input type="checkbox"/> Chamber C	<input type="checkbox"/> Chamber F
	<input type="checkbox"/> Chamber G
	<input checked="" type="checkbox"/> Chamber H

The above test sites and facilities are covered under FCC Test Firm Registration # 208313. UL Verification Services Inc. is accredited by NVLAP, Laboratory Code 200065-0. The full scope of accreditation can be viewed at <http://ts.nist.gov/standards/scopes/2000650.htm>.

## 4. CALIBRATION AND UNCERTAINTY

### 4.1. MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

### 4.2. SAMPLE CALCULATION

Where relevant, the following sample calculation is provided:

$$\begin{aligned}\text{Field Strength (dBuV/m)} &= \text{Measured Voltage (dBuV)} + \text{Antenna Factor (dB/m)} + \\ &\text{Cable Loss (dB)} - \text{Preamp Gain (dB)} \\ 36.5 \text{ dBuV} + 18.7 \text{ dB/m} + 0.6 \text{ dB} - 26.9 \text{ dB} &= 28.9 \text{ dBuV/m}\end{aligned}$$

### 4.3. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

PARAMETER	UNCERTAINTY
Conducted Disturbance, 0.15 to 30 MHz	$\pm 3.52$ dB
Radiated Disturbance, 30 to 1000 MHz	$\pm 4.94$ dB
Radiated Disturbance, 1 to 6 GHz	$\pm 3.86$ dB
Radiated Disturbance, 6 to 18 GHz	$\pm 4.23$ dB
Radiated Disturbance, 18 to 26 GHz	$\pm 5.30$ dB
Radiated Disturbance, 26 to 40 GHz	$\pm 5.23$ dB

Uncertainty figures are valid to a confidence level of 95%.

## 5. EQUIPMENT UNDER TEST

### 5.1. DESCRIPTION OF EUT

Fixed Point-to-Point radio in 5.3GHz unlicensed band with a proprietary communication management interface Intelligent Backhaul Radio.

The EUT uses 40, 20 and 10 MHz nominal bandwidths with QAM4, QAM16, QAM64, QAM256 modulation. The EUT can be powered by Power over Ethernet (PoE) or AC.

For operation in the U-NII-2A band, EUT drives two cross polarized antennas.

### 5.2. MANUFACTURER'S DESCRIPTION OF MODEL DIFFERENCES

There are two power options available for the EUT;

The PoE powered model is identified as:

- Model: IBR-1300-NA
- FCC ID: 2AAEH-107

The AC mains powered model is identified as:

- Model: IBR-1301-NA
- FCC ID: 2AAEH-107

### 5.3. MAXIMUM OUTPUT POWER

The transmitter has a maximum conducted output power as follows:

#### 5.3 GHz BAND

Bandwidth (MHz)	Frequency Range (MHz)	Mode	Output Power (dBm)	Output Power (mW)
<b>5.3 GHz Band, 2TX</b>				
Straddle(10MHz)	5250	FDD	10.70	11.75
10	5255 - 5340	FDD	10.76	11.91
Straddle(20MHz)	5250	FDD	12.84	19.23
20	5260 - 5335	FDD	13.64	23.12
Straddle(40MHz)	5250	FDD	14.63	29.04
40	5270 - 5325	FDD	14.87	30.69

### 5.4. DESCRIPTION OF AVAILABLE ANTENNAS

The radio utilizes a dipole array antenna, with a maximum gain of 15 dBi.

### 5.5. SOFTWARE AND FIRMWARE

The firmware installed in the EUT during testing was 1.6.8.

The test utility software used during testing was Tera Term, version 4.76.

## **5.6. WORST-CASE CONFIGURATION AND MODE**

Radiated emission and power line conducted emission were performed with the EUT set to transmit at the channel with highest output power as worst-case scenario.

All radiated testing was performed with the EUT in normal use orientation.

Based on the baseline scan, the worst-case data rates were:

10MHz bandwidth QAM 4

20MHz bandwidth QAM 4

40MHz bandwidth QAM 4

Data rate 38.4 Msamples/s for all bandwidths.

## 5.7. DESCRIPTION OF TEST SETUP

### SUPPORT EQUIPMENT

Support Equipment List				
Description	Manufacturer	Model	Serial Number	FCC ID
Laptop	Dell	Latitude E5420	CN-0H5TG2-75900-162-0089 A01	N/A
AC/DC Adapter	Dell	DAP130PE1-00	CN-0JU012-48661-14C-55WB-A04	N/A
POE	Tycon	TP-POE-HP-56G-FBN	157000258ARC00	N/A

### I/O CABLES

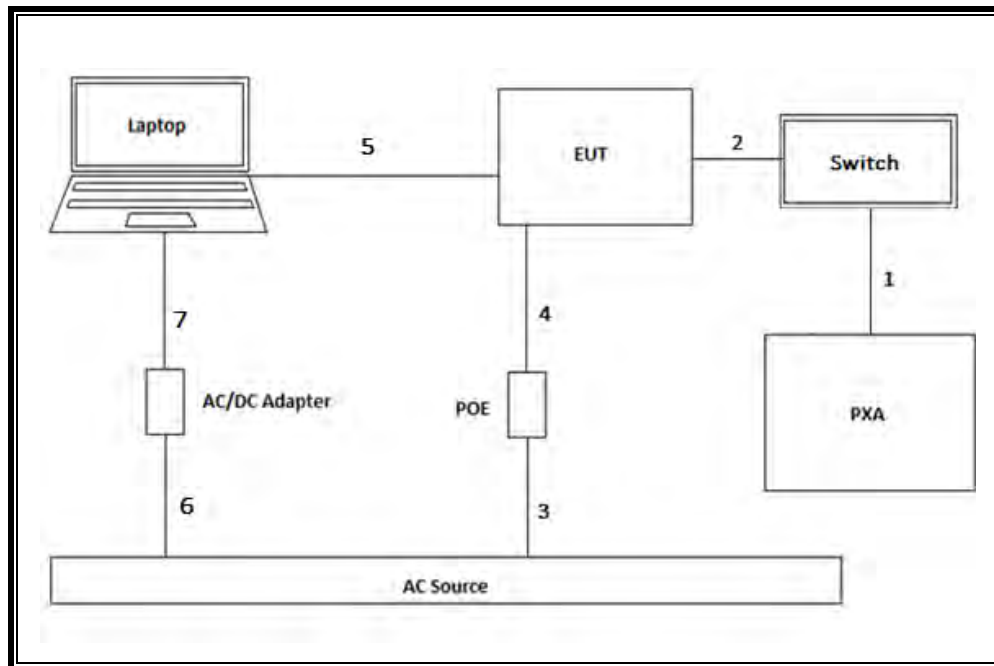

Cable No	Port	# of identical ports	Connector Type	Cable Type	Cable Length (m)	Remarks
1	RF Input	1	SMA	Shielded	1	To Analyzer
2	Antenna	4	SMA	Shielded	1	EUT to switch
3	AC	1	3 Prong	Un-Shielded	1	N/A
4	POE/LAN	1	RJ45	Shielded	20	N/A
5	USB/SERIAL	1	USB/10 pins	Shielded	1.5	USB to Laptop/Serial to EUT
6	AC	1	3-Prong	Un-Shielded	0.5	N/A
7	DC	1	Barrel	Un-Shielded	1.5	N/A
8	AC	1	Barrel	Un-Shielded	1.5	To EUT

### TEST SETUP

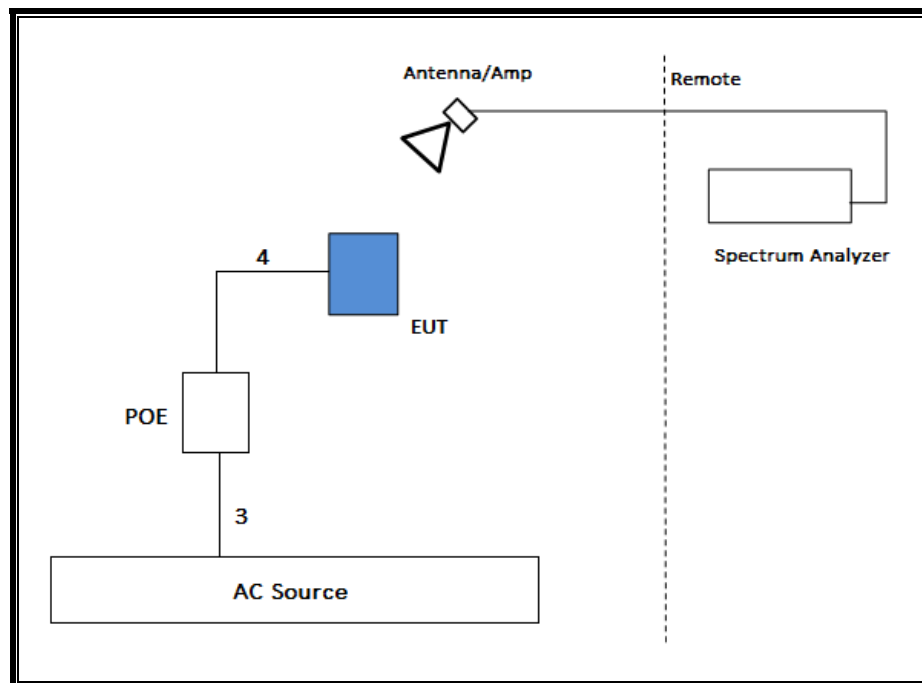

The EUT is a P-P outdoor radio used as a stand-alone device. Test software exercised the radio module.

## 7. MEASUREMENT METHODS

26 dB Emission BW: KDB 789033 D02 v01r, Section C.

Conducted Output Power: KDB 789033 D02 v01r01, Section E.2.c (Method SA-1 Alternative).

Power Spectral Density: KDB 789033 D02 v01r01, Section F.

Unwanted emissions in restricted bands: KDB 789033 D02 v01r01, Sections G.3, G.4, G.5, and G.6.

Unwanted emissions in non-restricted bands: KDB 789033 D02 v01r01, Sections G.3, G.4, and G.5.

KDB 662911 D01 Multiple Transmitter Output v02r01

KDB 662911 D02 MIMO with Cross-Polarized Antennas v01

## 8. ANTENNA PORT TEST RESULTS

### 8.1. ON TIME AND DUTY CYCLE

#### LIMITS

None; for reporting purposes only.

#### PROCEDURE

KDB 789033 Zero-Span Spectrum Analyzer Method.

#### ON TIME AND DUTY CYCLE RESULTS

Mode	ON Time B (msec)	Period (msec)	Duty Cycle x (linear)	Duty Cycle (%)	Duty Cycle Correction Factor (dB)	1/B Minimum VBW (kHz)
10MHz BW, 4TX	3.967	4.028	0.985	98.49%	0.00	0.010
20MHz BW, 4TX	3.967	4.028	0.985	98.49%	0.00	0.010
40MHz BW, 4TX	3.965	4.025	0.985	98.51%	0.00	0.010

## DUTY CYCLE PLOTS

## 8.2. 10MHz BW 2TX MODE IN THE 5.3 GHz BAND

### 8.2.1. 26 dB BANDWIDTH

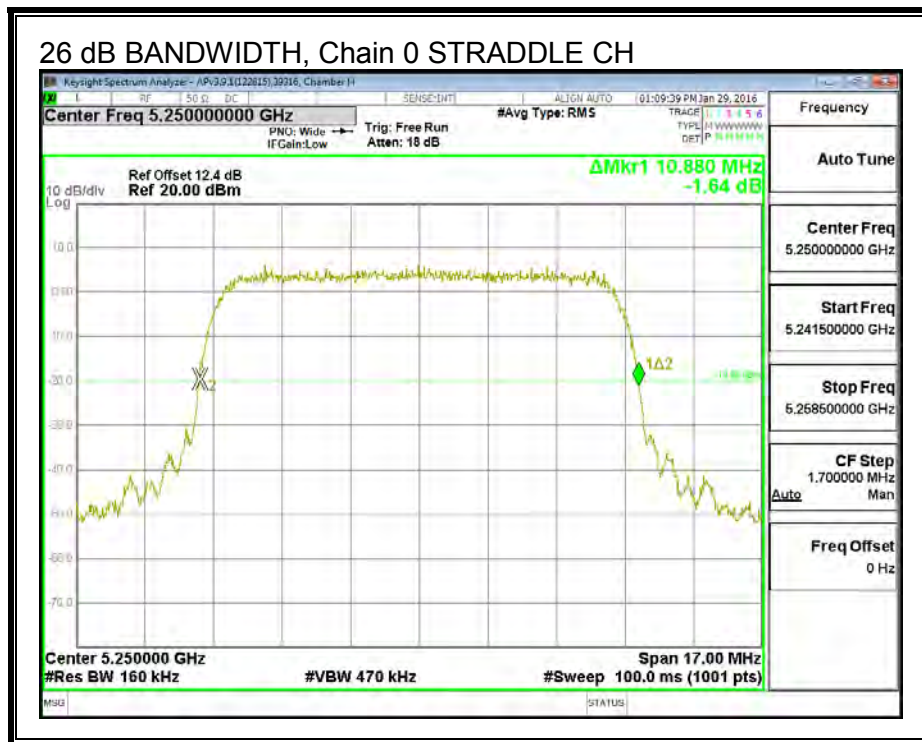

#### LIMITS

None; for reporting purposes only.

#### RESULTS

Channel	Frequency (MHz)	26 dB BW Chain 0 (MHz)	26 dB BW Chain 1 (MHz)
Straddle	5250	10.88	10.90
Low	5255	10.88	10.88
Mid	5300	10.88	10.88
High	5340	10.90	10.88

**26 dB BANDWIDTH, Chain 0**

**26 dB BANDWIDTH, Chain 1**

### 26 dB BANDWIDTH, Chain 1 MID CH

### 26 dB BANDWIDTH, Chain 1 HIGH CH

## 8.2.2. OUTPUT POWER AND PSD

### LIMITS

FCC §15.407 (a) (2)

For the band 5.25–5.35 GHz, the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 250 mW or 11 dBm + 10 log B, where B is the 26–dB emission bandwidth in MHz. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1–MHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the peak power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

### DIRECTIONAL ANTENNA GAIN

The TX chains are uncorrelated and the antenna gain is the same for each chain. The directional gain is equal to the antenna gain.

Chain 0 Antenna Gain (dBi)	Chain 1 Antenna Gain (dBi)	Uncorrelated Chains Directional Gain (dBi)
15.00	15.00	15.00

## RESULTS

### Bandwidth, Antenna Gain and Limits

## **8.2.4. CONDUCTED BANDEGE**

### **LIMITS**

FCC §15.205 and §15.209

PART 15, SUBPART E

Radiated LIMIT:

(2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

### **Procedure**

KDB 789033 D02 General UNII Test Procedures New Rules v01, Section II, G5, G6

Conducted measurements are being used to demonstrate compliance with the spurious limits in the restricted band (all other spurious emissions are measured using the radiated test method with the antennas connected). The limits are 54 dBuV/m average and 74 dBuV/m peak, which are equivalent to eirp of -41.2 dBm and -21.2 dBm respectively. The plots include an offset to account for the EUT antenna gain and external attenuation between EUT antenna port and spectrum analyzer. As the two antenna chains feed cross polarized antennas with un-correlated signals the two chains are treated independently and the emissions do not need to be summed.

### **8.3.4. CONDUCTED BANDEGE**

#### **LIMITS**

FCC §15.205 and §15.209

PART 15, SUBPART E

Radiated LIMIT:

(2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

#### **Procedure**

KDB 789033 D02 General UNII Test Procedures New Rules v01, Section II, G5, G6

Conducted measurements are being used to demonstrate compliance with the spurious limits in the restricted band (all other spurious emissions are measured using the radiated test method with the antennas connected). The limits are 54 dBuV/m average and 74 dBuV/m peak, which are equivalent to eirp of -41.2 dBm and -21.2 dBm respectively. The plots include an offset to account for the EUT antenna gain and external attenuation between EUT antenna port and spectrum analyzer. As the two antenna chains feed cross polarized antennas with un-correlated signals the two chains are treated independently and the emissions do not need to be summed.

## RESULTS

### HIGH CHANNEL BANDEDGE, Chain 0

**HIGH CHANNEL BANDEDGE, Chain 1**

## 8.4. 40MHz BW 2TX MODE IN THE 5.3 GHz BAND

### 8.4.1. 26 dB BANDWIDTH

#### LIMITS

None; for reporting purposes only.

#### RESULTS

Channel	Frequency (MHz)	26 dB BW Chain 0 (MHz)	26 dB BW Chain 1 (MHz)
Straddle	5250	43.16	43.23
Low	5270	43.16	43.10

**26 dB BANDWIDTH, Chain 1**

### 26 dB BANDWIDTH, Chain 1 MID CH

### 26 dB BANDWIDTH, Chain 1 HIGH CH

## 8.4.2. OUTPUT POWER AND PSD

### LIMITS

FCC §15.407 (a) (2)

For the band 5.25–5.35 GHz, the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 250 mW or  $11 \text{ dBm} + 10 \log B$ , where B is the 26–dB emission bandwidth in MHz. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1–MHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the peak power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

### DIRECTIONAL ANTENNA GAIN

The TX chains are uncorrelated and the antenna gain is the same for each chain. The directional gain is equal to the antenna gain.

Chain 0 Antenna Gain (dBi)	Chain 1 Antenna Gain (dBi)	Uncorrelated Chains Directional Gain (dBi)
15.00	15.00	15.00

## RESULTS

### HIGH CHANNEL BANDEDGE, Chain 0

**HIGH CHANNEL BANDEDGE, Chain 1**

## 9. RADIATED TEST RESULTS

### 9.1. LIMITS AND PROCEDURE

#### LIMITS

FCC §15.205 and §15.209

Frequency Range (MHz)	Field Strength Limit (uV/m) at 3 m	Field Strength Limit (dBuV/m) at 3 m
30 - 88	100	40
88 - 216	150	43.5
216 - 960	200	46
Above 960	500	54

#### TEST PROCEDURE

The EUT is placed on a non-conducting table 80 cm above the ground plane for below 1GHz and 150 cm for above 1GHz. The antenna to EUT distance is 3 meters.

For measurements below 1 GHz the resolution bandwidth is set to 100 kHz for peak detection measurements or 120 kHz for quasi-peak detection measurements. Peak detection is used unless otherwise noted as quasi-peak.

For measurements above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 3 MHz for peak measurements and as applicable for average measurements.

The spectrum from 30 MHz to 40 GHz is investigated with the transmitter set to the lowest, middle, and highest channels in each applicable band.

The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and the horizontal positions.

## 10. AC POWER LINE CONDUCTED EMISSIONS

### LIMITS

FCC §15.207 (a)

Frequency of Emission (MHz)	Conducted Limit (dBuV)	
	Quasi-peak	Average
0.15-0.5	66 to 56	56 to 46
0.5-5	56	46
5-30	60	50

\* Decreases with the logarithm of the frequency.

### TEST PROCEDURE

The EUT is placed on a non-conducting table 40 cm from the vertical ground plane and 80 cm above the horizontal ground plane. The EUT is configured in accordance with ANSI C63.10.

The receiver is set to a resolution bandwidth of 9 kHz. Peak detection is used unless otherwise noted as quasi-peak or average.

Line conducted data is recorded for both NEUTRAL and HOT lines

## 11. DYNAMIC FREQUENCY SELECTION

### 11.1. OVERVIEW

#### 11.1.1. LIMITS

#### INDUSTRY CANADA

IC RSS-247 is closely harmonized with FCC Part 15 DFS rules. The deviations are as follows:

RSS-247 Issue 1

**Note:** For the band 5600–5650 MHz, no operation is permitted.

Until further notice, devices subject to this annex shall not be capable of transmitting in the band 5600–5650 MHz. This restriction is for the protection of Environment Canada weather radars operating in this band.

#### FCC

§15.407 (h), FCC KDB 905462 D02 “COMPLIANCE MEASUREMENT PROCEDURES FOR UNLICENSED-NATIONAL INFORMATION INFRASTRUCTURE DEVICES OPERATING IN THE 5250-5350 MHz AND 5470-5725 MHz BANDS INCORPORATING DYNAMIC FREQUENCY SELECTION” and KDB 905462 D03 “U-NII CLIENT DEVICES WITHOUT RADAR DETECTION CAPABILITY”.

**Table 1: Applicability of DFS requirements prior to use of a channel**

Requirement	Operational Mode		
	Master	Client (without radar detection)	Client (with radar detection)
Non-Occupancy Period	Yes	Not required	Yes
DFS Detection Threshold	Yes	Not required	Yes
Channel Availability Check Time	Yes	Not required	Not required
U-NII Detection Bandwidth	Yes	Not required	Yes

**Table 2: Applicability of DFS requirements during normal operation**

Requirement	Operational Mode		
	Master	Client (without DFS)	Client (with DFS)
DFS Detection Threshold	Yes	Not required	Yes
Channel Closing Transmission Time	Yes	Yes	Yes
Channel Move Time	Yes	Yes	Yes
U-NII Detection Bandwidth	Yes	Not required	Yes

Additional requirements for devices with multiple bandwidth modes	Master Device or Client with Radar DFS	Client (without DFS)
<i>U-NII Detection Bandwidth and Statistical Performance Check</i>	All BW modes must be tested	Not required
<i>Channel Move Time and Channel Closing Transmission Time</i>	Test using widest BW mode available	Test using the widest BW mode available for the link
<i>All other tests</i>	Any single BW mode	Not required
<b>Note:</b> Frequencies selected for statistical performance check (Section 7.8.4) should include several frequencies within the radar detection bandwidth and frequencies near the edge of the radar detection bandwidth. For 802.11 devices it is suggested to select frequencies in all 20 MHz channel blocks and a null frequency between the bonded 20 MHz channel blocks.		

**Table 3: Interference Threshold values, Master or Client incorporating In-Service Monitoring**

Maximum Transmit Power	Value (see notes)
E.I.R.P. $\geq$ 200 mill watt	-64 dBm
E.I.R.P. < 200 mill watt and power spectral density < 10 dBm/MHz	-62 dBm
E.I.R.P. < 200 mill watt that do not meet power spectral density requirement	-64 dBm
<p><b>Note 1:</b> This is the level at the input of the receiver assuming a 0 dBi receive antenna</p> <p><b>Note 2:</b> Throughout these test procedures an additional 1 dB has been added to the amplitude of the test transmission waveforms to account for variations in measurement equipment. This will ensure that the test signal is at or above the detection threshold level to trigger a DFS response.</p> <p><b>Note 3:</b> E.I.R.P. is based on the highest antenna gain. For MIMO devices refer to KDB publication 662911 D01.</p>	

**Table 4: DFS Response requirement values**

Parameter	Value
<i>Non-occupancy period</i>	30 minutes
<i>Channel Availability Check Time</i>	60 seconds
<i>Channel Move Time</i>	10 seconds (See Note 1)
<i>Channel Closing Transmission Time</i>	200 milliseconds + approx. 60 milliseconds over remaining 10 second period. (See Notes 1 and 2)
<i>U-NII Detection Bandwidth</i>	Minimum 100% of the U- NII 99% transmission power bandwidth. (See Note 3)
<p><b>Note 1:</b> <i>Channel Move Time</i> and the <i>Channel Closing Transmission Time</i> should be performed with Radar Type 0. The measurement timing begins at the end of the Radar Type 0 burst.</p> <p><b>Note 2:</b> The <i>Channel Closing Transmission Time</i> is comprised of 200 milliseconds starting at the beginning of the <i>Channel Move Time</i> plus any additional intermittent control signals required to facilitate a <i>Channel</i> move (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.</p> <p><b>Note 3:</b> During the <i>U-NII Detection Bandwidth</i> detection test, radar type 0 should be used. For each frequency step the minimum percentage of detection is 90 percent. Measurements are performed with no data traffic.</p>	

**Table 5 – Short Pulse Radar Test Waveforms**

Radar Type	Pulse Width (usec)	PRI (usec)	Pulses	Minimum Percentage of Successful Detection	Minimum Trials
0	1	1428	18	See Note 1	See Note 1
1	1	Test A: 15 unique PRI values randomly selected from the list of 23 PRI values in table 5a	Roundup: $\{(1/360) \times (19 \times 10^6 \text{ PRI}_{\text{usec}})\}$	60%	30
		Test B: 15 unique PRI values randomly selected within the range of 518-3066 usec. With a minimum increment of 1 usec, excluding PRI values selected in Test A			
2	1-5	150-230	23-29	60%	30
3	6-10	200-500	16-18	60%	30
4	11-20	200-500	12-16	60%	30
Aggregate (Radar Types 1-4)				80%	120
<b>Note 1:</b> Short Pulse Radar Type 0 should be used for the <i>Detection Bandwidth</i> test, <i>Channel Move Time</i> , and <i>Channel Closing Time</i> tests.					

**Table 6 – Long Pulse Radar Test Signal**

Radar Waveform Type	Pulse Width (μsec)	Chirp Width (MHz)	PRI (μsec)	Pulses per Burst	Number of Bursts	Minimum Percentage of Successful Detection	Minimum Trials
5	50-100	5-20	1000-2000	1-3	8-20	80%	30

**Table 7 – Frequency Hopping Radar Test Signal**

Radar Waveform Type	Pulse Width (μsec)	PRI (μsec)	Pulses per Hop	Hopping Rate (kHz)	Hopping Sequence Length (msec)	Minimum Percentage of Successful Detection	Minimum Trials
6	1	333	9	0.333	300	70%	30

## **SYSTEM OVERVIEW**

The short pulse and long pulse signal generating system utilizes the NTIA software. The Vector Signal Generator has been validated by the NTIA. The hopping signal generating system utilizes the CCS simulated hopping method and system, which has been validated by the DoD, FCC and NTIA. The software selects waveform parameters from within the bounds of the signal type on a random basis using uniform distribution.

The short pulse types 1, 2, 3 and 4, and the long pulse type 5 parameters are randomized at run-time.

The hopping type 6 pulse parameters are fixed while the hopping sequence is based on the August 2005 NTIA Hopping Frequency List. The initial starting point randomized at run-time and each subsequent starting point is incremented by 475. Each frequency in the 100-length segment is compared to the boundaries of the EUT Detection Bandwidth and the software creates a hopping burst pattern in accordance with Section 7.4.1.3 Method #2 Simulated Frequency Hopping Radar Waveform Generating Subsystem of KDB 905462 D02. The frequency of the signal generator is incremented in 1 MHz steps from  $F_L$  to  $F_H$  for each successive trial. This incremental sequence is repeated as required to generate a minimum of 30 total trials and to maintain a uniform frequency distribution over the entire Detection Bandwidth.

The signal monitoring equipment consists of a spectrum analyzer. The aggregate ON time is calculated by multiplying the number of bins above a threshold during a particular observation period by the dwell time per bin, with the analyzer set to peak detection and max hold.

## **SYSTEM CALIBRATION**

A 50-ohm load is connected in place of the spectrum analyzer, and the spectrum analyzer is connected to a horn antenna via a coaxial cable, with the reference level offset set to (horn antenna gain – coaxial cable loss). The signal generator is set to CW mode. The amplitude of the signal generator is adjusted to yield a level of –64 dBm as measured on the spectrum analyzer.

Without changing any of the instrument settings, the spectrum analyzer is reconnected to the Common port of the Spectrum Analyzer Combiner/Divider. The Reference Level Offset of the spectrum analyzer is adjusted so that the displayed amplitude of the signal is –64 dBm.

The spectrum analyzer displays the level of the signal generator as received at the antenna ports of the Master Device. The interference detection threshold may be varied from the calibrated value of –64 dBm and the spectrum analyzer will still indicate the level as received by the Master Device.

## **ADJUSTMENT OF DISPLAYED TRAFFIC LEVEL**

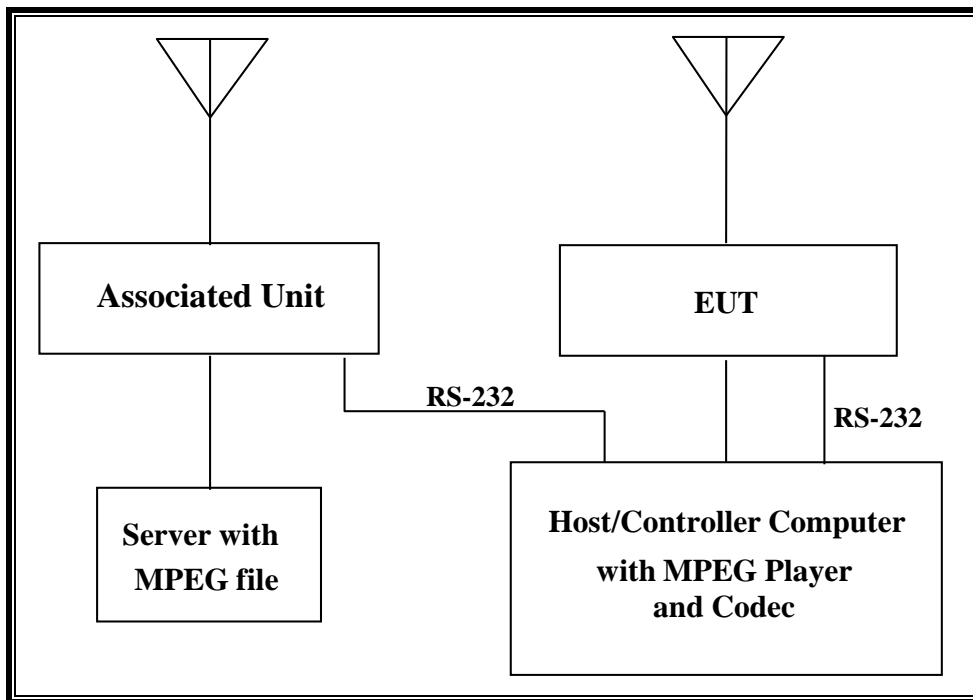

A link is established between the Master and Slave and the distance between the units is adjusted as needed to provide a suitable received level at the Master and Slave devices. The video test file is streamed to generate WLAN traffic. The monitoring antenna is adjusted so that the WLAN traffic level, as displayed on the spectrum analyzer, is at lower amplitude than the radar detection threshold.

## **TEST AND MEASUREMENT EQUIPMENT**

The following test and measurement equipment was utilized for the DFS tests documented in this report:

PERIPHERAL SUPPORT EQUIPMENT LIST

**MONITORING CONFIGURATION 1:**

**Note:** Monitoring Configuration 1 was used during Traffic/Channel Loading, Channel Move/Aggregate Time and Non-Occupancy testing.

**MONITORING CONFIGURATION 2:**

**Note:** Monitoring Configuration 2 was used during CAC testing.

#### **11.1.4. DESCRIPTION OF EUT**

For FCC the EUT operates over the 5250-5350 MHz and 5470-5725 MHz DFS ranges.

For IC the EUT operates over the 5250-5350 MHz and 5470-5725 MHz DFS ranges, excluding the 5600-5650 MHz DFS range.

The EUT is a Master Device.

The only DFS antenna assembly utilized with the EUT has a declared gain of 0 dBi.

The rated output power of the Master unit is > 23dBm (EIRP). Therefore the required interference threshold level is -64 dBm. After correction for procedural adjustments, the required radiated threshold at the antenna port is  $-64 + 1 = -63$  dBm.

The calibrated radiated DFS Detection Threshold level is set to -64 dBm. The tested level is lower than the required level hence it provides a margin to the limit.

The EUT uses two transmitter chains connected to the antennas to perform radiated tests.

The EUT provides radar detection capability for its associated transmitter.

The EUT is a Frame-based system. The Frame timing is set to a listen / talk ratio of 95%.

WLAN traffic is generated by streaming the video file TestFile.mp2 "6 ½ Magic Hours" from the Slave Transmitter to the Master Receiver in full motion video mode using the media player with the V2.61 Codec package.

TPC is required since the maximum EIRP is greater than 500 mW (27 dBm).

Three nominal channel bandwidths are implemented: 10 MHz, 20 MHz and 40 MHz.

The EUT always starts using a channel bandwidth of 10 MHz. After it has entered the operational phase when traffic can be passed it may select 10 MHz, 20 MHz or 40 MHz channel bandwidths depending on channel conditions.

The DFS sensor bandwidth is always wider than the widest nominal channel bandwidth. Therefore, 40 MHz Detection Bandwidth and CAC testing covers all nominal channel bandwidths.

The In-Service Monitoring tests were performed for each of the operational bandwidths.

The software installed in the access point is revision 1.6.8.

**UNIFORM CHANNEL SPREADING**

This function is not required per KDB 905462.

## 12. MASTER DFS TEST RESULTS

### 12.1. LOW BAND SENSOR 1 TEST CHANNEL

All tests were performed at a channel center frequency of 5285 MHz.

### 12.2. LOW BAND SENSOR 1 RADAR WAVEFORMS

#### RADAR WAVEFORMS

## CHANNEL LOADING

The level of traffic loading on the channel by the EUT is 96.86%.

### **12.3.2. CHANNEL AVAILABILITY CHECK TIME**

The DFS sensor bandwidth is always greater than the widest nominal channel bandwidth. Therefore, 40 MHz CAC testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

### **12.3.3. OVERLAPPING CHANNEL TESTS**

#### **RESULTS**

These tests are not applicable.

## 12.3.4. MOVE AND CLOSING TIME

### REPORTING NOTES

The reference marker is set at the end of last radar pulse.

The delta marker is set at the end of the last WLAN transmission following the radar pulse. This delta is the channel move time.

The aggregate channel closing transmission time is calculated as follows:

Aggregate Transmission Time =  
(Number of analyzer bins showing transmission) \* (dwell time per bin)

The observation period over which the aggregate time is calculated begins at (Reference Marker + 200 msec) and ends no earlier than (Reference Marker + 10 sec).

### RESULTS

#### No Radar Triggered

Start of CAC at 5685 MHz (sec)	End of CAC at 5685 MHz (sec)	CAC Time (sec)
128.4	189.4	61.0

#### Radar Near Beginning of CAC

Start of CAC at 5685 MHz (sec)	Timing of Radar Burst at 5685 MHz (sec)	Radar Relative to Start of CAC at 5685 MHz (sec)
147.6	151.6	4.0

#### Radar Near End of CAC

Start of CAC at 5685 MHz (sec)	Timing of Radar Burst at 5685 MHz (sec)	Radar Relative to Start of CAC at 5685 MHz (sec)
		0.0

**MOVE TIME**

**CHANNEL CLOSING TIME**

## AGGREGATE CHANNEL CLOSING TRANSMISSION TIME

Only intermittent transmissions are observed during the aggregate monitoring period.

## LONG PULSE CHANNEL MOVE TIME

The traffic ceases prior to 10 seconds after the end of the radar waveform.

## 12.3.5. DETECTION BANDWIDTH

### REFERENCE PLOT OF 99% POWER BANDWIDTH

## RESULTS

### No Radar Triggered

Start of CAC at 5685 MHz (hh:mm:ss)	End of CAC at 5685 MHz (hh:mm:ss)	CAC Time (hh:mm:ss)
0:02:18	0:03:19	0:01:01

### Radar Near Beginning of CAC

Start of CAC at 5685 MHz (hh:mm:ss)	Radar Detected at 5685 MHz (hh:mm:ss)	Radar Relative to Start of CAC (hh:mm:ss)
0:02:18	0:02:22	0:00:04

### Radar Near End of CAC

Start of CAC at 5685 MHz (hh:mm:ss)	Radar Detected at 5685 MHz (hh:mm:ss)	Radar Relative to Start of CAC (hh:mm:ss)
		0:00:00

The DFS sensor bandwidth is always greater than the widest nominal channel bandwidth. Therefore, 40 MHz Detection Bandwidth testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

For the purposes of testing In-Service Monitoring at this channel bandwidth the client has chosen to truncate the Detection Bandwidth to 10 MHz.

## 12.3.6. IN-SERVICE MONITORING

### RESULTS

FCC Radar Test Summary

## 12.4. LOW BAND SENSOR 1 RESULTS FOR 20 MHz BANDWIDTH

### 12.4.1. TRAFFIC AND CHANNEL LOADING

#### TRAFFIC

## CHANNEL LOADING

The level of traffic loading on the channel by the EUT is 96.56%

#### **12.4.2. CHANNEL AVAILABILITY CHECK TIME**

The DFS sensor bandwidth is always equal to or greater than the widest nominal channel bandwidth. Therefore, 40 MHz CAC testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

#### **12.4.3. OVERLAPPING CHANNEL TESTS**

##### **RESULTS**

These tests are not applicable.

#### 12.4.4. MOVE AND CLOSING TIME

##### REPORTING NOTES

The reference marker is set at the end of last radar pulse.

The delta marker is set at the end of the last WLAN transmission following the radar pulse. This delta is the channel move time.

The aggregate channel closing transmission time is calculated as follows:

Aggregate Transmission Time =  
(Number of analyzer bins showing transmission) \* (dwell time per bin)

The observation period over which the aggregate time is calculated begins at (Reference Marker + 200 msec) and ends no earlier than (Reference Marker + 10 sec).

##### RESULTS

Channel Move Time (sec)	Limit (sec)
0.0004	10

Aggregate Channel Closing Transmission Time (msec)	Limit (msec)
0.0	60

## MOVE TIME

**CHANNEL CLOSING TIME**

### AGGREGATE CHANNEL CLOSING TRANSMISSION TIME

No transmissions are observed during the aggregate monitoring period.

## LONG PULSE CHANNEL MOVE TIME

The traffic ceases prior to 10 seconds after the end of the radar waveform.

## 12.4.5. DETECTION BANDWIDTH

### REFERENCE PLOT OF 99% POWER BANDWIDTH

### RESULTS

FL	FH	Detection Bandwidth	99% Power Bandwidth	Ratio of Detection BW to 99% Power BW	Minimum Limit
(MHz)	(MHz)	(MHz)	(MHz)	(%)	(%)
5275	5295	20	19.719	101.4	100

The DFS sensor bandwidth is always greater than the widest nominal channel bandwidth. Therefore, 40 MHz Detection Bandwidth testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

For the purposes of testing In-Service Monitoring at this channel bandwidth the client has chosen to truncate the Detection Bandwidth to 20 MHz.

## 12.4.6. IN-SERVICE MONITORING

### RESULTS

## 12.5. LOW BAND SENSOR 1 RESULTS FOR 40 MHz BANDWIDTH

### 12.5.1. TRAFFIC AND CHANNEL LOADING

#### TRAFFIC

## CHANNEL LOADING

The level of traffic loading on the channel by the EUT is 94.64%

## 12.5.2. CHANNEL AVAILABILITY CHECK TIME

### PROCEDURE TO DETERMINE TEST CHANNEL CYCLE TIME

The AC power was toggled off and then on to re-boot the EUT while a spectrum analyzer sweep was started to monitor the test channel (5285 MHz) and a log file was generated. Upon completion of the CAC period on both the test channel in 5.3 GHz and the downlink 5.6 GHz, the downlink (which includes the 5.6 GHz DFS band) begins a “discovery phase” and In-Service Monitoring continues on both the 5.3 GHz and the 5.6 GHz DFS bands. The DFS channel enables are passed through the non-DFS connections until a link is established. When the 5.8 GHz downlink connects, the 5.3 GHz Uplink Transmitter is enabled. The 5.2/5.3 GHz Receive Radio then associates to the 5.2/5.3 GHz Transmit Radio. The 5.6/5.8 Receive Radio then associates to the 5.6/5.8 GHz Transmit Radio. After the association process was complete, transmissions began on the test channel. The elapsed time between the end of the CAC period and the start of transmissions on the test channel is the discovery time and association period. This reference measurement and the time stamps within the log file were used to determine when radar bursts were to be triggered at the beginning and end of the CAC period.

**Note:** The beginning of the CAC period is designated as the initialization of DFS sensor 2 (“RRC DFS[2]:sensor init”) in the log file. Two DFS sensors are initialized in sequence but CAC does not begin until the timestamp on the second initialization.

### PROCEDURE FOR TIMING OF RADAR BURST

The AC power was toggled off and then on to re-boot the EUT while a spectrum analyzer sweep was started to monitor the test channel (5285 MHz) and a log file was generated. A radar signal was triggered on the test channel between 0 to 6 seconds after the beginning of the CAC period and transmissions on the test channel were monitored on the spectrum analyzer.

The AC power was then again toggled off and then on to re-boot the EUT while a spectrum analyzer sweep was started to monitor the test channel (5285 MHz) and a log file was generated. A radar signal was triggered on the test channel between 54 to 60 seconds after the beginning of the CAC period and transmissions on the test channel were monitored on the spectrum analyzer.

The log file recorded the timing of these events. The time from the beginning of the CAC on the test channel to the detection of the radar burst on the test channel was measured.

## **APPROXIMATE QUANTITATIVE RESULTS BASED ON RF MARKERS**

### **NO RADAR TRIGGERED ON THE TEST CHANNEL**

The time between the beginning of the CAC period and the start of transmissions on the test channel minus the elapsed time for the Receive Radio to associate to the Transmit Radio is the CAC time.

### **RADAR TRIGGERED ON THE TEST CHANNEL**

The time from the beginning of the CAC period to the radar burst on the test channel was measured as the approximate relative time from the start of the CAC.

#### **No Radar Triggered**

Start of CAC at 5285 MHz (sec)	End of CAC at 5285 MHz (sec)	CAC Time (sec)
144.3	205.3	61.0

#### **Radar Near Beginning of CAC**

Start of CAC at 5285 MHz (sec)	Timing of Radar Burst at 5285 MHz (sec)	Radar Relative to Start of CAC at 5285 MHz (sec)
148.5	153.5	5.0

#### **Radar Near End of CAC**

Start of CAC at 5285 MHz (sec)	Timing of Radar Burst at 5285 MHz (sec)	Radar Relative to Start of CAC at 5285 MHz (sec)
146.5	204.5	58.0

**QUANTITATIVE RESULTS BASED ON EUT TEST MODE LOG FILE TIME STAMPS**

**No Radar Triggered**

Start of CAC at 5285 MHz (hh:mm:ss)	End of CAC at 5285 MHz (hh:mm:ss)	CAC Time (hh:mm:ss)
0:02:17	0:03:18	0:01:01

**Radar Near Beginning of CAC**

Start of CAC at 5285 MHz (hh:mm:ss)	Radar Detected at 5285 MHz (hh:mm:ss)	Radar Relative to Start of CAC (hh:mm:ss)
0:02:19	0:02:24	0:00:05

**Radar Near End of CAC**

Start of CAC at 5285 MHz (hh:mm:ss)	Radar Detected at 5285 MHz (hh:mm:ss)	Radar Relative to Start of CAC (hh:mm:ss)
0:02:17	0:03:15	0:00:58

**QUALITATIVE RESULTS**

Timing of Radar Burst	Display on Control Computer	Spectrum Analyzer Display
No Radar Triggered	EUT marks Channel as active	Transmissions begin on channel after the completion of the association period following CAC
Within 0 to 6 second window	EUT indicates radar detected	No transmissions on channel
Within 54 to 60 second window	EUT indicates radar detected	No transmissions on channel

## TIMING WITHOUT RADAR DURING CAC

Start of CAC @ 5285 MHz

End of CAC,  
Beginning of "Discovery"

Association Complete  
Transmissions Initiated @ 5285 MHz

Transmissions begin on intended channel after completion of CAC.

### 12.5.3. OVERLAPPING CHANNEL TESTS

#### RESULTS

These tests are not applicable.

### 12.5.4. MOVE AND CLOSING TIME

#### REPORTING NOTES

The reference marker is set at the end of last radar pulse.

The delta marker is set at the end of the last WLAN transmission following the radar pulse. This delta is the channel move time.

The aggregate channel closing transmission time is calculated as follows:

Aggregate Transmission Time =  
(Number of analyzer bins showing transmission) \* (dwell time per bin)

The observation period over which the aggregate time is calculated begins at (Reference Marker + 200 msec) and ends no earlier than (Reference Marker + 10 sec).

#### RESULTS

Channel Move Time (sec)	Limit (sec)
0.000	10

Aggregate Channel Closing Transmission Time (msec)	Limit (msec)
0.0	60

## MOVE TIME

**CHANNEL CLOSING TIME**

### AGGREGATE CHANNEL CLOSING TRANSMISSION TIME

No transmissions are observed during the aggregate monitoring period.

## LONG PULSE CHANNEL MOVE TIME

The traffic ceases prior to 10 seconds after the end of the radar waveform.

## 12.5.5. NON-OCCUPANCY PERIOD

### RESULTS

No EUT transmissions were observed on the test channel during the 30-minute observation time.

## 12.5.6. DETECTION BANDWIDTH

### REFERENCE PLOT OF 99% POWER BANDWIDTH

### RESULTS

FL	FH	Detection Bandwidth	99% Power Bandwidth	Ratio of Detection BW to 99% Power BW	Minimum Limit
(MHz)	(MHz)	(MHz)	(MHz)	(%)	(%)

## **12.6. LOW BAND CAC DUAL SENSOR BAND BLOCKING VERIFICATION**

### **12.6.1. TEST PROCEDURE**

The spectrum analyzer is tuned to 5270 MHz and the log file from the EUT records the events.

The power to the EUT is cycled and a sweep is concurrently started on the spectrum analyzer. After the EUT boots-up a CAC period is simultaneously performed on 5270 MHz and 5310 MHz.

A radar burst is triggered on 5270 MHz approximately 5 seconds into the CAC period. In response to this the EUT places 5270 MHz on the blocked channel list. A radar burst is then triggered approximately 52 seconds later on 5310 MHz. After the second detection the EUT places 5305 MHz on the blocked channel list and removes itself from service in the 5.3 GHz band.

Once the non-occupancy period is complete on 5270 MHz the channel is cleared from the blocked channel list. A CAC period is performed on the cleared channel and upon successful completion the EUT enters service.

## 12.6.2. RADAR WAVEFORMS

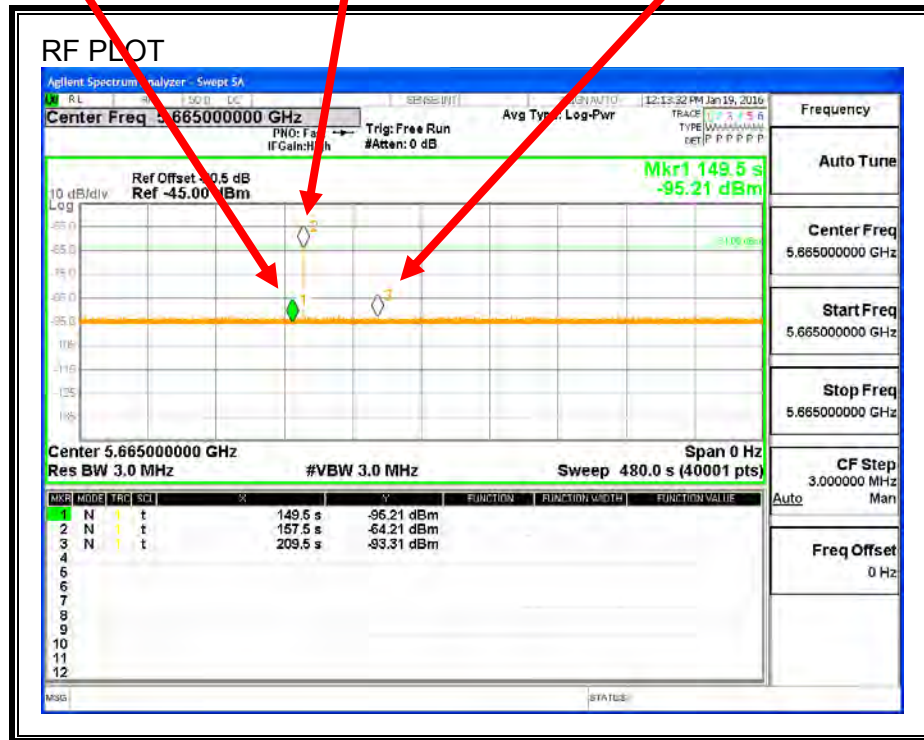

### 12.6.3. TEST RESULTS

#### RF PLOT

CAC @ 5270 MHz  
and 5310 MHz

Radar @ 5270 MHz

Radar @ 5310 MHz

## 12.7. HIGH BAND SENSOR 2 TEST CHANNEL

All tests were performed at a channel center frequency of 5685 MHz.

## 12.8. HIGH BAND SENSOR 2 RADAR WAVEFORMS

### RADAR WAVEFORMS

## 12.9. HIGH BAND SENSOR 2 RESULTS FOR 10 MHz BANDWIDTH

### 12.9.1. TRAFFIC AND CHANNEL LOADING

#### TRAFFIC

## CHANNEL LOADING

The level of traffic loading on the channel by the EUT is 94.3%

### **12.9.2. CHANNEL AVAILABILITY CHECK TIME**

The DFS sensor bandwidth is always equal to or greater than the widest nominal channel bandwidth. Therefore, 40 MHz CAC testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

### **12.9.3. OVERLAPPING CHANNEL TESTS**

#### **RESULTS**

These tests are not applicable.

#### 12.9.4. MOVE AND CLOSING TIME

##### REPORTING NOTES

The reference marker is set at the end of last radar pulse.

The delta marker is set at the end of the last WLAN transmission following the radar pulse. This delta is the channel move time.

The aggregate channel closing transmission time is calculated as follows:

Aggregate Transmission Time =  
(Number of analyzer bins showing transmission) \* (dwell time per bin)

The observation period over which the aggregate time is calculated begins at (Reference Marker + 200 msec) and ends no earlier than (Reference Marker + 10 sec).

##### RESULTS

Channel Move Time (sec)	Limit (sec)
0.0128	10

Aggregate Channel Closing Transmission Time (msec)	Limit (msec)
0.0	60

**MOVE TIME**

**CHANNEL CLOSING TIME**

### AGGREGATE CHANNEL CLOSING TRANSMISSION TIME

No transmissions are observed during the aggregate monitoring period.

## LONG PULSE CHANNEL MOVE TIME

The traffic ceases prior to 10 seconds after the end of the radar waveform.

## 12.9.1. DETECTION BANDWIDTH

### REFERENCE PLOT OF 99% POWER BANDWIDTH

### RESULTS

FL	FH	Detection Bandwidth	99% Power Bandwidth	Ratio of Detection BW to 99% Power BW	Minimum Limit
(MHz)	(MHz)	(MHz)	(MHz)	(%)	(%)
5680	5690	10	9.853	101.5	100

The DFS sensor bandwidth is always greater than the widest nominal channel bandwidth. Therefore, 40 MHz Detection Bandwidth testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

For the purposes of testing In-Service Monitoring at this channel bandwidth the client has chosen to truncate the Detection Bandwidth to 10 MHz.

## 12.9.2. IN-SERVICE MONITORING

### RESULTS

FCC Radar Test Summary

## 12.10. HIGH BAND SENSOR 2 RESULTS FOR 20 MHz BANDWIDTH

### 12.10.1. TRAFFIC AND CHANNEL LOADING

#### TRAFFIC

## CHANNEL LOADING

The level of traffic loading on the channel by the EUT is 95.78%

### **12.10.2. CHANNEL AVAILABILITY CHECK TIME**

The DFS sensor bandwidth is always equal to or greater than the widest nominal channel bandwidth. Therefore, 40 MHz CAC testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

### **12.10.3. OVERLAPPING CHANNEL TESTS**

#### **RESULTS**

These tests are not applicable.

#### 12.10.4. MOVE AND CLOSING TIME

##### REPORTING NOTES

The reference marker is set at the end of last radar pulse.

The delta marker is set at the end of the last WLAN transmission following the radar pulse. This delta is the channel move time.

The aggregate channel closing transmission time is calculated as follows:

Aggregate Transmission Time =  
(Number of analyzer bins showing transmission) \* (dwell time per bin)

The observation period over which the aggregate time is calculated begins at (Reference Marker + 200 msec) and ends no earlier than (Reference Marker + 10 sec).

##### RESULTS

Channel Move Time (sec)	Limit (sec)
0.0132	10

Aggregate Channel Closing Transmission Time (msec)	Limit (msec)
0.0	60

**MOVE TIME**

**CHANNEL CLOSING TIME**

### AGGREGATE CHANNEL CLOSING TRANSMISSION TIME

No transmissions are observed during the aggregate monitoring period.

## LONG PULSE CHANNEL MOVE TIME

The traffic ceases prior to 10 seconds after the end of the radar waveform.

## 12.10.5. DETECTION BANDWIDTH

### REFERENCE PLOT OF 99% POWER BANDWIDTH

### RESULTS

FL	FH	Detection Bandwidth	99% Power Bandwidth	Ratio of Detection BW to 99% Power BW	Minimum Limit
(MHz)	(MHz)	(MHz)	(MHz)	(%)	(%)
5675	5695	20	19.683	101.6	100

The DFS sensor bandwidth is always greater than the widest nominal channel bandwidth. Therefore, 40 MHz Detection Bandwidth testing covers all nominal channel bandwidths and this test was not performed for this channel bandwidth.

For the purposes of testing In-Service Monitoring at this channel bandwidth the client has chosen to truncate the Detection Bandwidth to 20 MHz.

## 12.10.6. IN-SERVICE MONITORING

### RESULTS

FCC Radar Test Summary								
Signal Type	Number of Trials	Detection (%)	Limit (%)	Pass/Fail	Detection Bandwidth		80% of Det BW	
					FL	FH	FL5	FH5
FCC Short Pulse Type 1	30	100.00	60	Pass	5675	5695		
FCC Short Pulse Type 2	30	93.33	60	Pass	5675	5695		
FCC Short Pulse Type 3	30	96.67	60	Pass	5675	5695

## 12.11.2. CHANNEL AVAILABILITY CHECK TIME

### PROCEDURE TO DETERMINE TEST CHANNEL CYCLE TIME

The AC power was toggled off and then on to re-boot the EUT while a spectrum analyzer sweep was started to monitor the test channel (5685 MHz) and a log file was generated. Upon completion of the CAC period on both the test channel in 5.6 GHz and the uplink 5.3 GHz, the downlink (which includes the 5.6 GHz DFS band) begins a “discovery phase” and In-Service Monitoring continues on both the 5.3 GHz and the 5.6 GHz DFS bands. The DFS channel enables are passed through the non-DFS connections until a link is established. When the 5.8 GHz downlink connects, the 5.3 GHz Uplink Transmitter is enabled. The 5.2/5.3 GHz Receive Radio then associates to the 5.2/5.3 GHz Transmit Radio. The 5.6/5.8 Receive Radio then associates to the 5.6/5.8 GHz Transmit Radio. After the association process was complete, transmissions began on the test channel. The elapsed time between the end of the CAC period and the start of transmissions on the test channel is the discovery time and association period. This reference measurement and the time stamps within the log file were used to determine when radar bursts were to be triggered at the beginning and end of the CAC period.

**Note:** The beginning of the CAC period is designated as the initialization of DFS sensor 2 (“RRC DFS[2]:sensor init”) in the log file. Two DFS sensors are initialized in sequence but CAC does not begin until the timestamp on the second initialization.

### PROCEDURE FOR TIMING OF RADAR BURST

The AC power was toggled off and then on to re-boot the EUT while a spectrum analyzer sweep was started to monitor the test channel (5685 MHz) and a log file was generated. A radar signal was triggered on the test channel between 0 to 6 seconds after the beginning of the CAC period and transmissions on the test channel were monitored on the spectrum analyzer.

The AC power was then again toggled off and then on to re-boot the EUT while a spectrum analyzer sweep was started to monitor the test channel (5685 MHz) and a log file was generated. A radar signal was triggered on the test channel between 54 to 60 seconds after the beginning of the CAC period and transmissions on the test channel were monitored on the spectrum analyzer.

The log file recorded the timing of these events. The time from the beginning of the CAC on the test channel to the detection of the radar burst on the test channel was measured.

## **APPROXIMATE QUANTITATIVE RESULTS BASED ON RF MARKERS**

### **NO RADAR TRIGGERED ON THE TEST CHANNEL**

The time between the beginning of the CAC period and the start of transmissions on the test channel minus the elapsed time for the Receive Radio to associate to the Transmit Radio is the CAC time.

### **RADAR TRIGGERED ON THE TEST CHANNEL**

The time from the beginning of the CAC period to the radar burst on the test channel was measured as the approximate relative time from the start of the CAC.

#### **No Radar Triggered**

Start of CAC at 5685 MHz (sec)	End of CAC at 5685 MHz (sec)	CAC Time (sec)
130.2	191.2	61.0

#### **Radar Near Beginning of CAC**

Start of CAC at 5685 MHz (sec)	Timing of Radar Burst at 5685 MHz (sec)	Radar Relative to Start of CAC at 5685 MHz (sec)
157.5	159.5	2.0

#### **Radar Near End of CAC**

Start of CAC at 5685 MHz (sec)	Timing of Radar Burst at 5685 MHz (sec)	Radar Relative to Start of CAC at 5685 MHz (sec)
157.3	215.3	58.0

**QUANTITATIVE RESULTS BASED ON EUT TEST MODE LOG FILE TIME STAMPS**

**No Radar Triggered**

Start of CAC at 5685 MHz (hh:mm:ss)	End of CAC at 5685 MHz (hh:mm:ss)	CAC Time (hh:mm:ss)
0:02:18	0:03:19	0:01:01

**Radar Near Beginning of CAC**

Start of CAC at 5685 MHz (hh:mm:ss)	Radar Detected at 5685 MHz (hh:mm:ss)	Radar Relative to Start of CAC (hh:mm:ss)
0:02:28	0:02:30	0:00:02

**Radar Near End of CAC**

Start of CAC at 5685 MHz (hh:mm:ss)	Radar Detected at 5685 MHz (hh:mm:ss)	Radar Relative to Start of CAC (hh:mm:ss)
0:02:28	0:03:26	0:00:58

**QUALITATIVE RESULTS**

Timing of Radar Burst	Display on Control Computer	Spectrum Analyzer Display
No Radar Triggered	EUT marks Channel as active	Transmissions begin on channel after the completion of the association period following CAC
Within 0 to 6 second window	EUT indicates radar detected	No transmissions on channel
Within 54 to 60 second window	EUT indicates radar detected	No transmissions on channel

# TIMING WITHOUT RADAR DURING CAC

Start of CAC @ 5685 MHz      End of CAC,  
Beginning of "Discovery"      Association Complete  
Transmissions Initiated @ 5685 MHz

Transmissions begin on intended channel after completion of CAC.

### 12.11.3. OVERLAPPING CHANNEL TESTS

#### RESULTS

These tests are not applicable.

### 12.11.4. MOVE AND CLOSING TIME

#### REPORTING NOTES

The reference marker is set at the end of last radar pulse.

The delta marker is set at the end of the last WLAN transmission following the radar pulse. This delta is the channel move time.

The aggregate channel closing transmission time is calculated as follows:

Aggregate Transmission Time =  
(Number of analyzer bins showing transmission) \* (dwell time per bin)

The observation period over which the aggregate time is calculated begins at (Reference Marker + 200 msec) and ends no earlier than (Reference Marker + 10 sec).

#### RESULTS

Channel Move Time (sec)	Limit (sec)
0.012	10

Aggregate Channel Closing Transmission Time (msec)	Limit (msec)
0.0	60

**MOVE TIME**

**CHANNEL CLOSING TIME**

### AGGREGATE CHANNEL CLOSING TRANSMISSION TIME

No transmissions are observed during the aggregate monitoring period.

## LONG PULSE CHANNEL MOVE TIME

The traffic ceases prior to 10 seconds after the end of the radar waveform.

## 12.11.5. NON-OCCUPANCY PERIOD

### RESULTS

No EUT transmissions were observed on the test channel during the 30-minute observation time.

## 12.11.6. DETECTION BANDWIDTH

### REFERENCE PLOT OF 99% POWER BANDWIDTH

### RESULTS

FL	FH	Detection Bandwidth	99% Power Bandwidth	Ratio of Detection BW to 99% Power BW	Minimum Limit
(MHz)	(MHz)	(MHz)	(MHz)	(%)	(%)
5665	5705	40	39.282	101.8	100

## **12.12. HIGH BAND CAC DUAL SENSOR BAND BLOCKING VERIFICATION**

### **12.12.1. TEST PROCEDURE**

The spectrum analyzer is tuned to 5665 MHz and the log file from the EUT records the events.

The power to the EUT is cycled and a sweep is concurrently started on the spectrum analyzer. After the EUT boots-up a CAC period is simultaneously performed on 5665 MHz and 5705 MHz.

A radar burst is triggered on 5665 MHz approximately 8 seconds into the CAC period. In response to this the EUT places 5665 MHz on the blocked channel list. A radar burst is then triggered approximately 52 seconds later on 5705 MHz. After the second detection the EUT places 5705 MHz on the blocked channel list and removes itself from service in the 5.7 GHz band.

Once the non-occupancy period is complete on 5665 MHz the channel is cleared from the blocked channel list. A CAC period is performed on the cleared channel and upon successful completion the EUT enters service.

## 12.12.2. RADAR WAVEFORMS

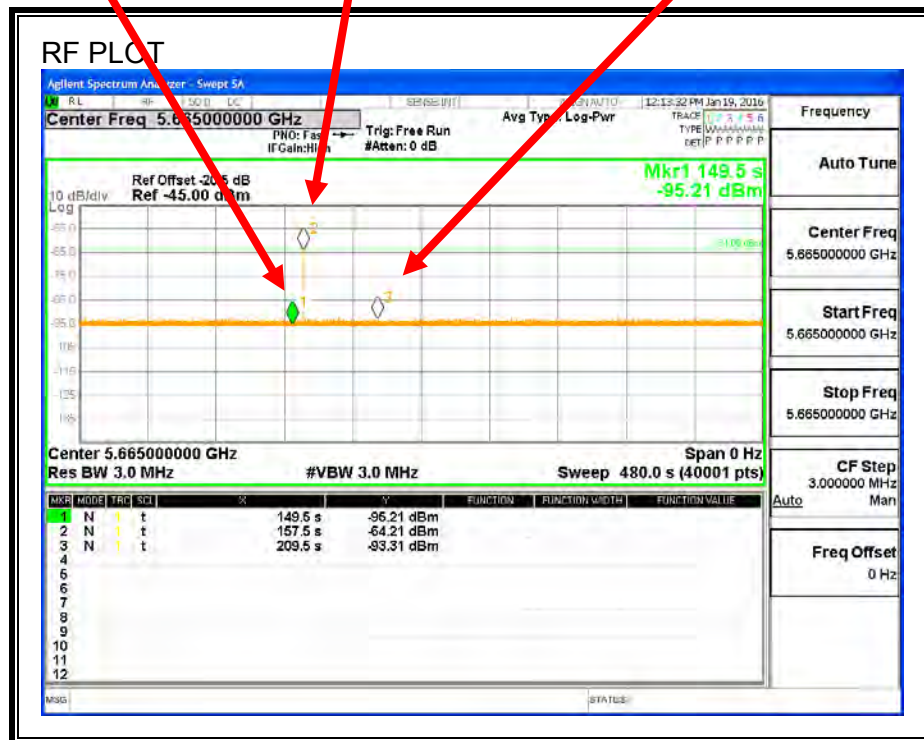

### 12.12.3. TEST RESULTS

#### RF PLOT

CAC @ 5665 MHz  
and 5705 MHz

Radar @ 5665 MHz

Radar @ 5705 MHz
