

## RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq 50$  mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0 \text{ for 1-g SAR and } \leq 7.5 \text{ for 10-g extremity SAR, where}$

走  $f(\text{GHz})$  is the RF channel transmit frequency in GHz

走 Power and distance are rounded to the nearest mW and mm before calculation

走 The result is rounded to one decimal place for comparison

Worse case is as below: [2437MHz 7.53dBm( 5.66mW) output power]

(5.66mW /5mm)  $\cdot [\sqrt{2.437} (\text{GHz})] = 1.77 < 3.0$  for 1-g SAR

Then SAR evaluation is not required
