SNUPI Technologies

TEST REPORT FOR

Water Sensor Node
Model: 810-00011

Tested To The Following Standards:

FCC Part 15 Subpart C § 15.247

Report No.: 96653-16

Date of issue: February 17, 2015

ACCREDITED
Testing Certificates:
803.01, 803.02, 803.05, 803.06

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

Testing the Future
CKC LABORATORIES, INC.

ADMINISTRATIVE INFORMATION

Test Report Information

REPORT PREPARED FOR:

SNUPI Technologies
4512 University Way NE
Seattle, WA 98105

Representative: Patrick Vilbrandt
Customer Reference Number: 1095

REPORT PREPARED BY:

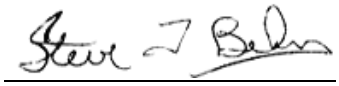
Dianne Dudley
CKC Laboratories, Inc.
5046 Sierra Pines Drive
Mariposa, CA 95338

Project Number: 96653

DATE OF EQUIPMENT RECEIPT: January 27, 2015
DATE(S) OF TESTING: January 27-29, 2015

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.



Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S):
CKC Laboratories, Inc.
22116 23rd Drive S.E., Suite A
Bothell, WA 98021-4413

SUMMARY OF RESULTS

Standard / Specification: FCC Part 15 Subpart C § 15.247

Test Procedure	Description	Modifications*	Results
15.247(a)(2)	-6dB Occupied Bandwidth	NA	Pass
15.247(b)(3)	Maximum Power Output	NA	Pass
15.247(d)	Radiated Spurious Emissions and Band Edge	NA	Pass
15.247(e)	Power Spectral Density	NA	Pass

NA = Not applicable

Modifications* During Testing

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions
No modifications were made during testing.

***Modifications listed above must be incorporated into all production units.**

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions
None

EQUIPMENT UNDER TEST (EUT)

EQUIPMENT UNDER TEST

Water Sensor Node
Manuf: SNUPI Technologies
Model: 810-00011
Serial: 90-7A-F1-FF-FB-FC

PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

N300 Wireless Router
Manuf: Netgear
Model: WNR2000 v4
Serial: NA

Laptop
Manuf: Dell
Model: Precision M4400
Serial: NA

FCC PART 15 SUBPART C

15.247(a)(2) -6dB Occupied Bandwidth

Test Conditions / Setup

The EUT's antenna is non-removable, thus the data is gathered through radiated measurements. The EUT is located on top of a Styrofoam table, 80cm over the ground plane. The EUT is investigated in its laying and standing positions with only the worst case being reported.

Temperature: 23°C
Relative Humidity: 41%
Pressure: 103.3kPa
Date Tested: 1/27/15
Test Method: KDB 558074 D01 DTS Meas Guidance v03r02

Engineer: Steven Pittsford

Correction factors are factored into the spectrum analyzer screen captures.

P = (Ed)^2 / (30 * G)

E = Field strength of the measurement converted to V/M
d = Measurement distance in meters
G = Numerical gain of the EUT's antenna relative to an isotropic radiator.
P = The power in watts for which we are solving

Frequency (MHz)	Corrections due to cables, Amplifiers and antennas (dB)	Corrected Reading (dBm)	Antenna Gain (dBi)	Conducted Power (Watts)

15. 247(e) Power Spectral Density

Test Conditions / Setup

The EUT's antenna is non-removable, thus the data is gathered through radiated measurements. The EUT is located on top of a Styrofoam table, 80cm over the ground plane. The EUT is connected to Wireless router located outside the test chamber via an unshielded Cat 5e cable operating at 100M. This router is then connected to the laptop.

Test Conditions:
Temperature: 23°C
Relative Humidity: 41%
Pressure: 103.3kPa
Date Tested: 1/29/15
Test Method: KDB 558074 D01 DTS Meas Guidance v03r02

Test Engineer: Steven Pittsford

Test Equipment

Asset #	Description	Manufacturer	Model	Cal Date	Cal Due
01996	Biconilog Antenna	Chase	CBL6111C	7/16/2014	7/16/2016
02307	Preamp	HP	8447D	3/14/2014	3/14/2016
P05360	Cable	Belden	RG214	12/1/2014	12/1/2016
P06505	Cable	Astrolab	32026-29080-29080-84	10/18/2013	10/18/2015
02872	Spectrum Analyzer	Agilent	E4440A	7/19/2013	7/19/2015
P05963	Cable	Belden	RG-214	2/21/2014	2/21/2016

Correction factors are factored into the spectrum analyzer screen captures.

P = 10log((Ed)^2 / (30 * G)*1000)

E = Field strength of the measurement converted to V/M
d = Measurement distance in meters
G = Numerical gain of the EUT's antenna relative to an isotropic radiator.
P = The power in dBm for which we are solving

Frequency (MHz)	Corrections due to cables, amplifiers, antennas (dB)	Corrected Reading (dBm)	Antenna Gain (dBi)	Spectral Density (dBm)
906	0.7	-19.0	-7.4	-1.78
914	0.8	-20.2	-8.1	-0.28
924	1.0	-21.5	-9.4	-0.33

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dBµV/m, the spectrum analyzer reading in dBµV was corrected by using the following formula. This reading was then compared to the applicable specification limit.

SAMPLE CALCULATIONS		
	Meter reading	(dBµV)
+	Antenna Factor	(dB)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dBµV/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
