Declination of responsibility	Information relating to the description of the sample, components list and software/hardware version (if reported) are provided by the customer. CMC Centro Misura Compatibilità S.r.l. cannot be considered responsible for these information, for any other document sent by the customer and for any difference between the software version present in the tested sample and that present in the object intended for final sale. In some cases, the software in the tested sample is in a version dedicated exclusively to the test, and therefore does not represent the software installed in the final version of the product.

8 Test conditions

8.1 General

Environmental reference conditions.....:	The climatic conditions during the tests are within the limits specified by the manufacturer for the operation of the EUT and the test equipment.		
	The climatic conditions during the tests were within the following limits:		
	Temperature	Humidity	Atmospheric pressure
	15 °C – 35 °C	30 % - 60 %	800 hPa – 1060 hPa
	If explicitly required in the basic standard or applied product standard the climatic values are recorded and documented separately in this test report.

9.1 RF Exposure Analysis

Tested by	C. Panozzo
Test date	14.07.2022
Test location (stand)	Laboratory
Reference standards	KDB 447498 D01 cl. 4 ANSI C63.10
Supplementary information.....	--

Acceptance limits

1 mW/cm² max at 20 cm of distance

Results

Standalone operation

Transmission mode	Transmission channel (MHz)	Measured level	Peak Output Power (mW)	Power Density at 20 cm (mW/cm ²)	Power Density Limit (mW/cm ²)
RFID	433,31	74,66 dBμV/m	0,097	0,00001	0,289
RFID	434,71	75,47 dBμV/m	0,117	0,00001	0,290
BLE (certified module)	2440	4,56 dBm	2,86	0,001	1,627

Remarks

$$P = (E \times d)^2 / (30 \times G) \times 1000$$

Where:

E = the measured maximum fundamental field strength in V/m

G = the numeric gain of the transmitting antenna: 0,339 (-4,70 dBi) for RFID, 1,778 (2,5 dBi) for BLE

d = the distance in meters from which the field strength was measured (3 m)

P = the power in mW

$$\text{Power Density} = (P \times G) / (4\pi R^2)$$

Simultaneous transmission

Transmission mode	FCC ID of module	Measured level	Highest Peak Output Power (mW)	Power Density at 20 cm (mW/cm ²)	Overall Power Density (mW/cm ²)	Power Density Limit (mW/cm ²)
RFID	2ADEOWIT202	75,47 dBμV/m	0,117	0,00001	0,00101	0,290
BLE (certified module)	SQGBL652	4,56 dBm	2,86	0,001		

Remarks: Power Density = $(P \times G) / (4\pi R^2)$. Only the maximum BLE power and RFID power have been used for the calculation. The power density limit is the more stringent limit between the limit for BLE and the limit for RFID.

Note 1:

The expanded uncertainty reported according to the document EA-4-02 is based on a standard uncertainty multiplied by a coverage factor of k=2, providing a level of confidence of p = 95%

Note 2:

It has been demonstrated that the used test equipment meets the specified requirements in the standard with at least a 95% confidence, covering factor k=2

Judgement of compliance

Case 1	Case 2	Case 3	Case 4
 The sample complies with the requirements. The measurement results is within the specification limit when the measurement uncertainty is taken into account.	 The sample complies with the requirements. It is not possible to state compliance using a 95% coverage probability for the expanded uncertainty although the measurement result is below the limit.	 The sample does not comply with the requirements. It is not possible to state compliance using a 95% coverage probability for the expanded uncertainty also the measurement result is upper the limit.	 The sample does not comply with the requirements. The measurement results is outside the specification limit when the measurement uncertainty is taken into account.
