TEST RESULT

The requirements of the tests performed as shown in the overview (chapter 4 of this test report) were fulfilled by the equipment under test.
The complete test results are presented in the following.

	Name	Signature	Date
Test engineer:	Thomas KÜHN		25 November 2014
Authorized reviewer:	Michael DINTER		25 November 2014

RESERVATION

This test report is only valid in its original form.

Any reproduction of its contents in extracts without written permission of the accredited test laboratory PHOENIX TESTLAB GmbH is prohibited.

The test results herein refer only to the tested sample. PHOENIX TESTLAB GmbH is not responsible for any generalisations or conclusions drawn from these test results concerning further samples. Any modification of the tested samples is prohibited and leads to the invalidity of this test report. Each page necessarily contains the PHOENIX TESTLAB Logo and the TEST REPORT NUMBER.

1.3 Test laboratory

The tests were carried out at:

PHOENIX TESTLAB GmbH
Königswinkel 10
32825 Blomberg
Germany

Test Laboratory (CAB) accredited by Deutsche Akkreditierungsstelle GmbH (DAkkS) in compliance with DIN EN ISO/IEC 17025 under the Reg. No. D-PL-17186-01-02,
recognized by Bundesnetzagentur under the Reg.-No. BNetzA-CAB-02/21-104.
CAB Designation Number DE0004, listed by FCC 31040/SIT1300F2, IC OATS Listing 3469A-1.

1.4 EUT (Equipment Under Test)

Equipment under test: *	Short Range Device
Model name: *	RXM030S012PNP8A
Type of equipment: *	Contactless connectivity System
Serial number: *	2287598 (TX) / 2287598 (RX)
PCB identifier: *	M30 Rx V01R05 (RX)
Hardware version: *	A1
Software version: *	V01R05
Highest / lowest internal frequency: *	2.482 GHz / 16 MHz
FCC ID / IC	2ADK2-ARISORX / 12496A-ARISORX

*: Declared by the applicant.

1.5 Technical data of equipment

Rated RF output power: *	0.1 mW					
Emission classification: *	F1D					
Antenna type: *	Integral					
Antenna gain: *	-4 dBi					
Power supply: *	U_{nom}=	24.0 V DC	U_{min}=	21.6 V DC	U_{max}=	26.4 V DC
Type of modulation: *	GFSK					
Operating frequency range:*	2482.083 MHz					
Number of channels: *	1					
Temperature range: *	-20 °C to +55 °C					

*: Declared by the applicant.

The following external I/O cables were used:

Identification	Connector		Length
	EUT	Ancillary	
TX	12 pole M12 connector	12 pole M12 connector	3 m
RX	12 pole M12 connector	12 pole M12 connector	3 m

*: Length during the test if no other specified.

1.6 Dates

Date of receipt of test sample:	13 October 2014
Start of test:	13 October 2014
End of test:	20 October 2014

2 Operational states and physical boundaries

All tests were carried out with unmodified samples, which were operating in normal operation mode. The ARISO system consists of two parts:

- EUT:
  A 2.483 GHz transmitter (RXM030S012PNP8A). This device will be powered by the 200 kHz carrier and transmits data to the 200 kHz transmitter. It will be not able to transmit, if no 200 kHz signal is received.
- Auxiliary equipment:
  A 200 kHz transmitter (TXM030S012PNP8A). This device transmits an unmodulated carrier and will be supplied with 24 V DC. It contains also a 2.483 GHz receiver. As declared by the applicant, the 200 kHz transmission will be stopped, if no 2.483 GHz signal is received.

Because the functionality from the other system part is necessary for operation both devices could only tested together. Therefore no separate measurements of the receiver emissions could be carried out, because the receiver needs the signal from the collocated simultaneously operating transmitter.

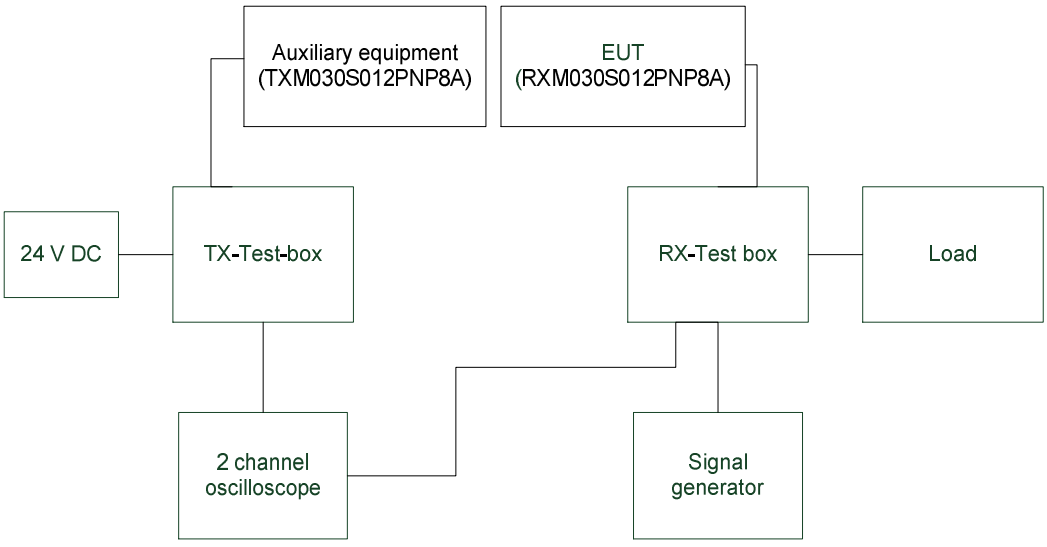
The measurement results of the auxiliary equipment (200 kHz transmitter) are not object of this test report, they will be documented in separate test reports (F145554E3 (FCC) and F145554E4 (IC)).

Both parts of the system were positioned in its maximum distance to each other (7 mm). With higher distances both parts of the system will cease function.

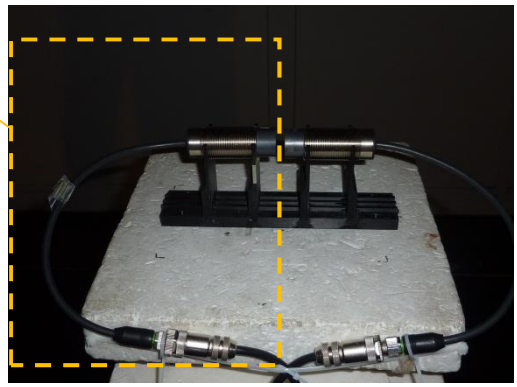
During all tests the auxiliary equipment (TXM030S012PNP8A) of the system connected to a test-box and was supplied with 24 V DC. The received data was monitored on channel one of a two channel oscilloscope.

The EUT part (RXM030S012PNP8A) of the system was also connected to a test box. One input channel of the EUT was connected via the test box to a signal generator. In order to simulate the maximum power consumption of the EUT part it was connected to a programmable load. The signal of the signal generator was displayed on the second channel of the two channel oscilloscope.

The drawing below shows the setup schematically:



Physical boundaries of the EUT:



3 ADDITIONAL INFORMATION

As stated by the applicant, the ARISO system is available in two different versions. One version has a four pole connector and one a 12 pole connector. Both versions are using the same PCB; the only difference is the use of different connectors. All tests were carried out with the 12 pole version of the system, because it was regarded as worst case configuration concerning the power consumption and transmitted data rate.

As declared by the applicant the following FCC IDs / IC were used:

Model name	Version	FCC ID	IC
TXM030S012PNP2A	Four pole	2ADK7-ARISOTX	12496A-ARISOTX
TXM030S012PNP8A	12 pole		
RXM030S012PNP2A	Four pole	2ADK7-ARISORX	12496A-ARISORX
RXM030S012PNP8A and RXM030S012PNP8B	12 pole		

4 Overview

Application	Frequency range [MHz]	FCC 47 CFR Part 15 section [2]	RSS-Gen, Issue 4 [3] RSS-210, Issue 8 [4]	Status	Refer page
Conducted emissions on supply line	0.15 - 30	15.207 (a)	8.8 [3]	Not applicable *	----
Radiated emissions	0.009 - 25,000	15.205 (a) 15.209 (a)	8.9 [3] 2.5[4]	Passed	13 et seq.
99 % bandwidth	2,482.083	-	6.6 [3]	Passed	Annex D

*: Not applicable, because the RXM030S012PNP8A has no power supply connector. It will be supplied wireless by the TXM030S012PNP8A. The emissions from this device will be documented in separate test reports (F145554E3 (FCC) and F145554E4 (IC)).

5 Test results

5.1 Radiated emissions

5.1.1 Method of measurement (radiated emissions)

The radiated emission measurement is subdivided into five stages.

- A preliminary measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 9 kHz to 1 GHz.
- A final measurement carried out on an outdoor test side without reflecting ground plane and a fixed antenna height in the frequency range 9 kHz to 30 MHz.
- A final measurement carried out on an open area test side with reflecting ground plane and various antenna height in the frequency range 30 MHz to 1 GHz.
- A preliminary measurement carried out in a fully anechoic chamber with a variable antenna distance and height in the frequency range 1 GHz to 110 GHz.
- A final measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 1 GHz to 110 GHz.

All measurements will be carried out with the EUT working on the middle and upper and lower edge of the assigned frequency band.

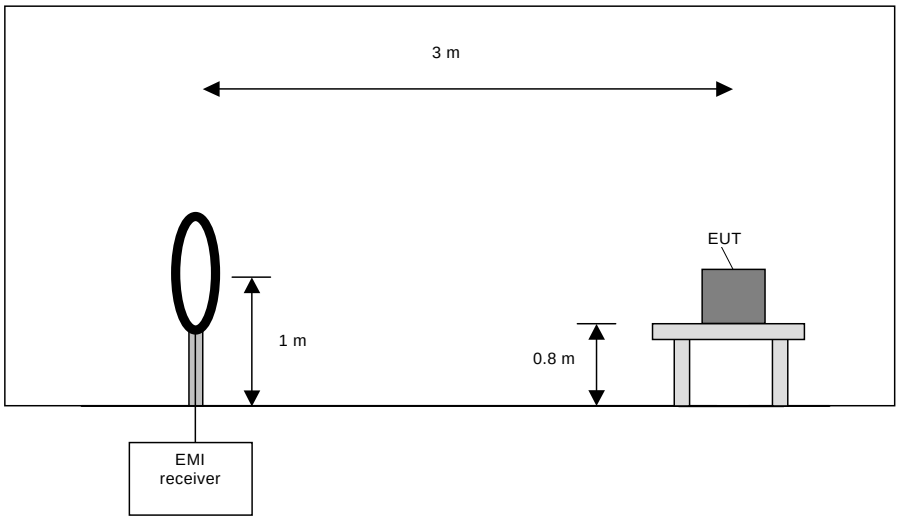
Preliminary measurement (9 kHz to 30 MHz):

In the first stage a preliminary measurement will be performed in a shielded room with a measuring distance of 3 meters. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2009 [1].].

The frequency range 9 kHz to 30 MHz will be monitored with a spectrum analyser while the system and its cables will be manipulated to find out the configuration with the maximum emission levels if applicable. The EMI Receiver will be set to MAX Hold mode. The EUT and the measuring antenna will be rotated around their vertical axis to found the maximum emissions.

The resolution bandwidth of the spectrum analyser will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	10 kHz



Preliminary measurement procedure:

Prescans were performed in the frequency range 9 kHz to 150 kHz and 150 kHz to 30 MHz.

The following procedure will be used:

1) Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
2) Manipulate the system cables within the range to produce the maximum level of emission.
3) Rotate the EUT by 360 ° to maximize the detected signals.
4) Make a hardcopy of the spectrum.
5) Measure the frequencies of highest detected emission with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
6) Repeat steps 1) to 5) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).
7) Rotate the measuring antenna and repeat steps 1) to 5).

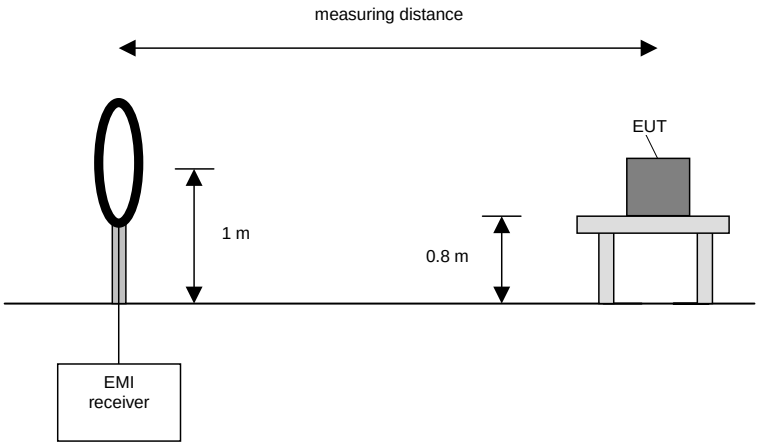
Final measurement (9 kHz to 30 MHz):

In the second stage a final measurement will be performed on an open area test site with no conducting ground plane in a measuring distances of 3 m, 10 m and 30 m. In the case where larger measuring distances are required the results will be extrapolated based on the values measured on the closer distances according to Section 15.31 (f) (2) [2]. The final measurement will be performed with a EMI Receiver set to Quasi Peak detector except for the frequency bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where an average detector will be used according Section 15.209 (d) [2].

On the during the preliminary measurement detected frequencies the final measurement will be performed while rotating the EUT and the measuring antenna in the range of 0 ° to 360 ° around their vertical axis until the maximum value is found.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz



Final measurement procedure:

The following procedure will be used:

1) Monitor the frequency range with the measuring antenna at vertical orientation parallel to the EUT at an azimuth of 0 °.
2) Rotate the EUT by 360 ° to maximize the detected signals and note the azimuth and orientation.
3) Rotate the measuring antenna to find the maximum and note the value.
4) Rotate the measuring antenna and repeat steps 1) to 3) until the maximum value is found.
5) Repeat steps 1) to 4) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).

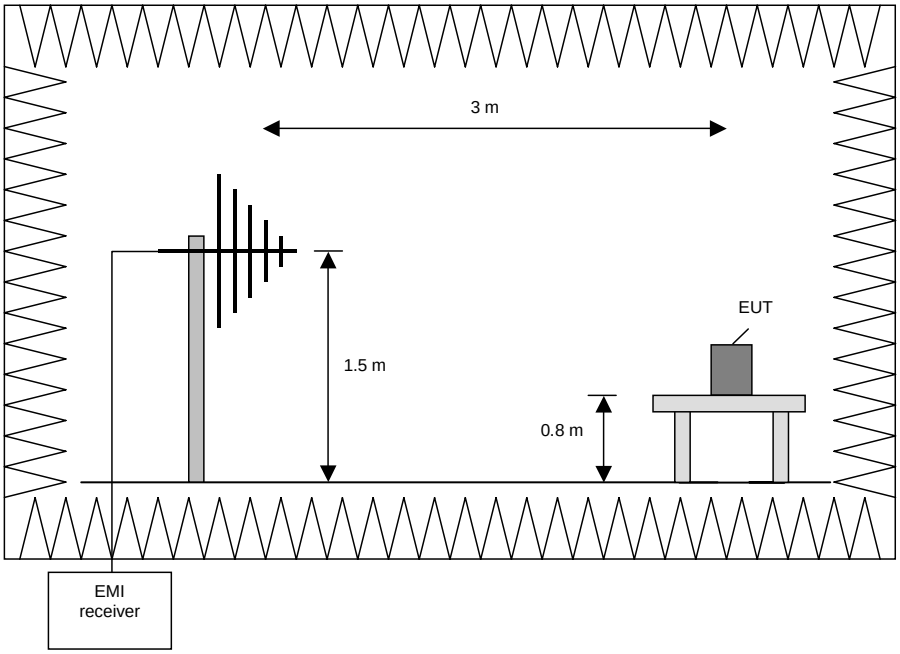
Preliminary measurement (30 MHz to 1 GHz)

In the first stage a preliminary measurement will be performed in a fully anechoic chamber with a measuring distance of 3 meter. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2009 [1].

The frequency range 30 MHz to 1 GHz will be measured with an EMI Receiver set to MAX Hold mode and a resolution bandwidth of 100 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 °.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 230 MHz	100 kHz
230 MHz to 1 GHz	100 kHz



Procedure preliminary measurement:

Prescans were performed in the frequency range 30 MHz to 230 MHz and 230 MHz to 1 GHz.
The following procedure will be used:

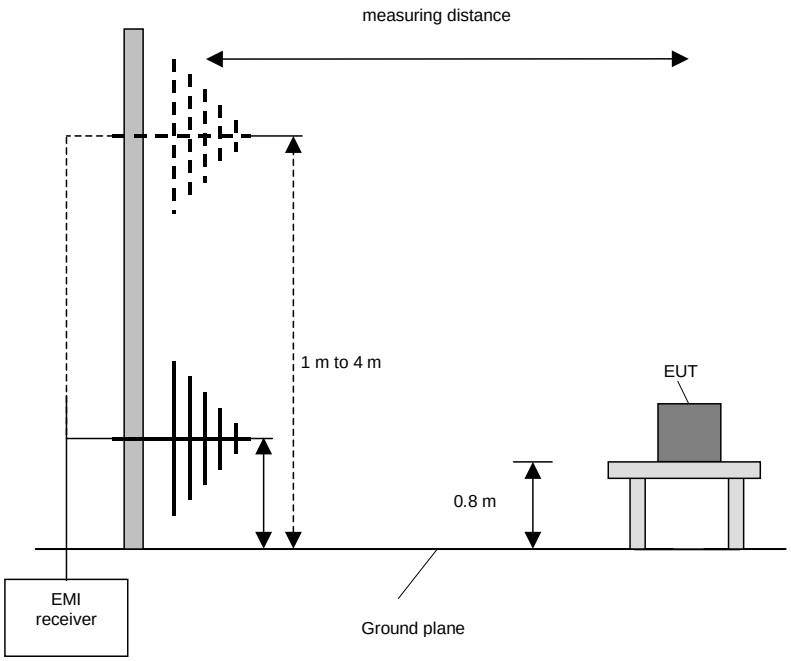
1. Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
2. Manipulate the system cables within the range to produce the maximum level of emission.
3. Rotate the EUT by 360 ° to maximize the detected signals.
4. Make a hardcopy of the spectrum.
5. Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
6. Repeat 1) to 4) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).
7. Repeat 1) to 5) with the vertical polarisation of the measuring antenna.

Final measurement (30 MHz to 1 GHz)

A final measurement on an open area test site will be performed on selected frequencies found in the preliminary measurement. During this test the EUT will be rotated in the range of 0 ° to 360 °, the measuring antenna will be set to horizontal and vertical polarisation and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 1 GHz	120 kHz



Procedure final measurement:

The following procedure will be used:

1) Measure on the selected frequencies at an antenna height of 1 m and a EUT azimuth of 23 °.
2) Move the antenna from 1 m to 4 m and note the maximum value at each frequency.
3) Rotate the EUT by 45 ° and repeat 2) until an azimuth of 337 ° is reached.
4) Repeat 1) to 3) for the other orthogonal antenna polarization.
5) Move the antenna and the turntable to the position where the maximum value is detected.
6) Measure while moving the antenna slowly +/- 1 m.
7) Set the antenna to the position where the maximum value is found.
8) Measure while moving the turntable +/- 45 °.
9) Set the turntable to the azimuth where the maximum value is found.
10) Measure with Final detector (QP and AV) and note the value.
11) Repeat 5) to 10) for each frequency.
12) Repeat 1) to 11) for each orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).

Preliminary and final measurement (1 GHz to 110 GHz)

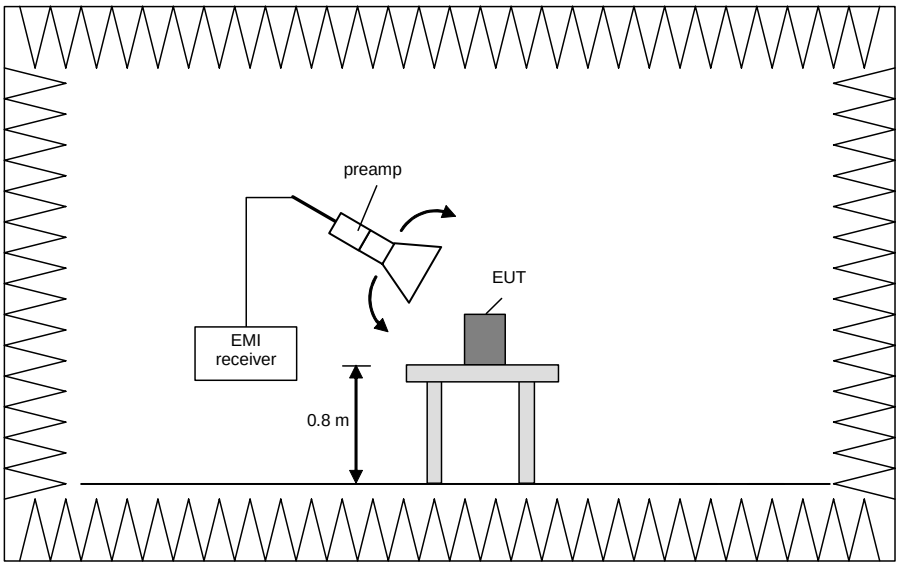
This measurement will be performed in a fully anechoic chamber. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2009 [1].

Preliminary measurement (1 GHz to 110 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used horn antenna. The spectrum analyser set to MAX Hold mode and a resolution bandwidth of 100 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna, the antenna close to the EUT and while moving the antenna over all sides of the EUT. With the spectrum analyser in CLEAR / WRITE mode the cone of the emission should be found and then the measuring distance will be set to 3 m with the receiving antenna moving in this cone of emission. At this position the final measurement will be carried out.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	100 kHz
4 GHz to 12 GHz	100 kHz
12 GHz to 18 GHz	100 kHz
18 GHz to 26.5 GHz	100 kHz
26.5 GHz to 40 GHz	100 kHz
40 GHz to 60 GHz	100 kHz
50 GHz to 75 GHz	100 kHz
75 GHz to 110 GHz	100 kHz

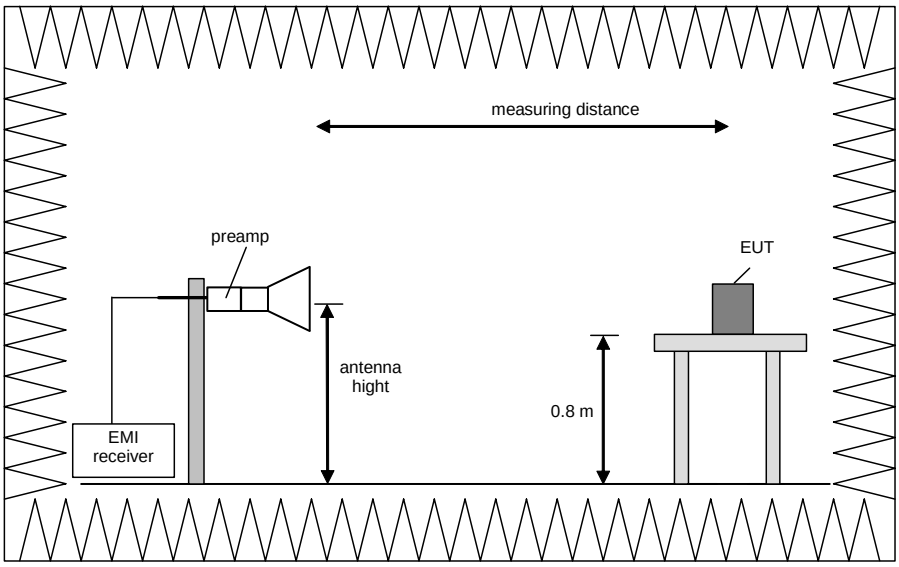


Final measurement (1 GHz to 110 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used horn antenna. The EMI Receiver set to peak and average mode and a resolution bandwidth of 1 MHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 ° in order to have the antenna inside the cone of radiation.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	1 MHz
4 GHz to 12 GHz	1 MHz
12 GHz to 18 GHz	1 MHz
18 GHz to 26.5 GHz	1 MHz
26.5 GHz to 40 GHz	1 MHz
40 GHz to 60 GHz	1 MHz
50 GHz to 75 GHz	1 MHz
75 GHz to 110 GHz	1 MHz



Procedure of measurement:

The measurements were performed in the frequency range 1 GHz to 4 GHz, 4 GHz to 12 GHz, 12 GHz to 18 GHz, 18 GHz to 26.5 GHz, 26.5 GHz to 40 GHz, 40 GHz to 60 GHz, 60 GHz to 75 GHz and 75 GHz to 110 GHz.
The following procedure will be used:

1) Monitor the frequency range at horizontal polarisation and move the antenna over all sides of the EUT (if necessary move the EUT to another orthogonal axis).
2) Change the antenna polarisation and repeat 1) with vertical polarisation.
3) Make a hardcopy of the spectrum.
4) Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
5) Change the analyser mode to Clear / Write and found the cone of emission.
6) Rotate and move the EUT, so that the measuring distance can be enlarged to 3 m and the antenna will be still inside the cone of emission.
7) Measure the level of the detected frequency with the correct resolution bandwidth, with the antenna polarisation and azimuth and the peak and average detector, which causes the maximum emission.
8) Repeat steps 1) to 7) for the next antenna spot if the EUT is larger than the antenna beamwidth.

Step 1) to 6) are defined as preliminary measurement.

5.1.2 Preliminary radiated emission tests (1 MHz to 30 MHz)

Ambient temperature:	21 °C	Relative humidity:	60 %

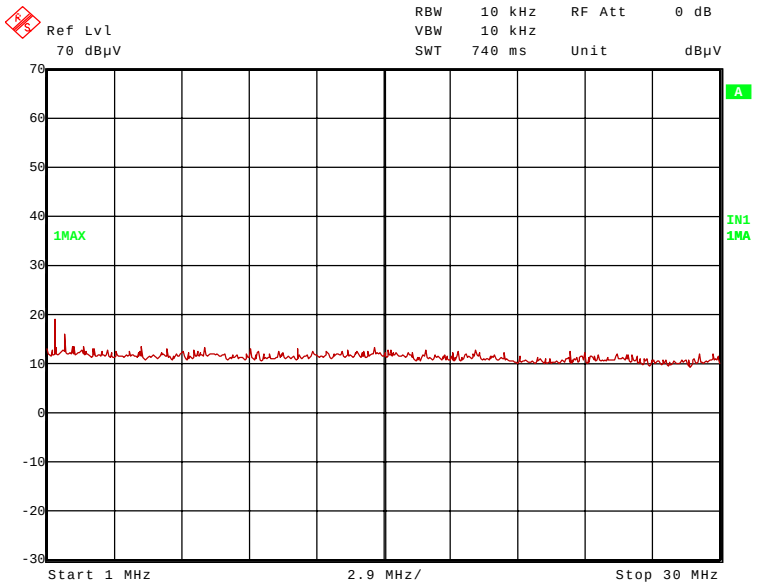
Position of EUT: The EUT was set-up on a wooden table of a height of 0.8 m.

Cable guide: The cable of the EUT was fixed on the non-conducting table. For further information of the cable guide refer to the pictures in annex A of this test report.

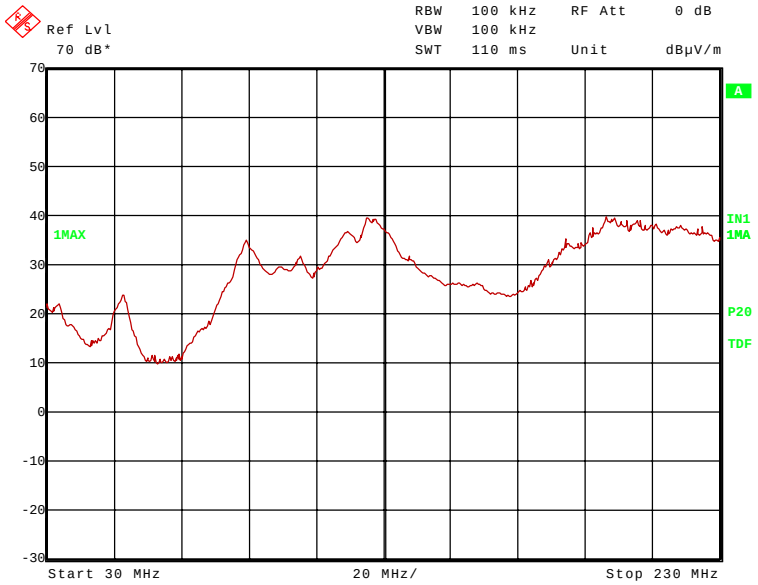
Test record: The test was carried out in normal operation mode of the EUT (refer also clause 2 of this test report). All results are shown in the following.

Power supply: During this test the EUT was powered with 24 DC via wireless power transfer.

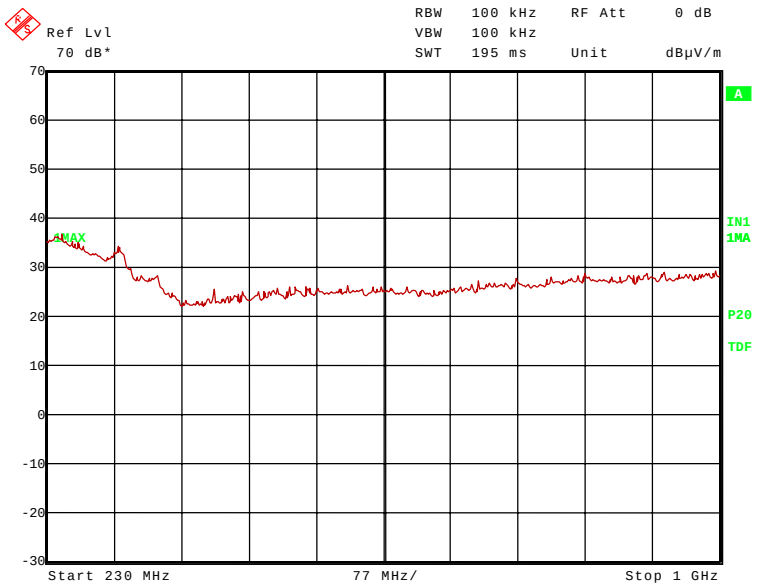
145554_2.wmf: Spurious emissions from 1 MHz to 30 MHz:



145554_4.wmf: Spurious emissions from 30 MHz to 230 MHz:



145554_5.wmf: Spurious emissions from 230 MHz to 1 GHz:



The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

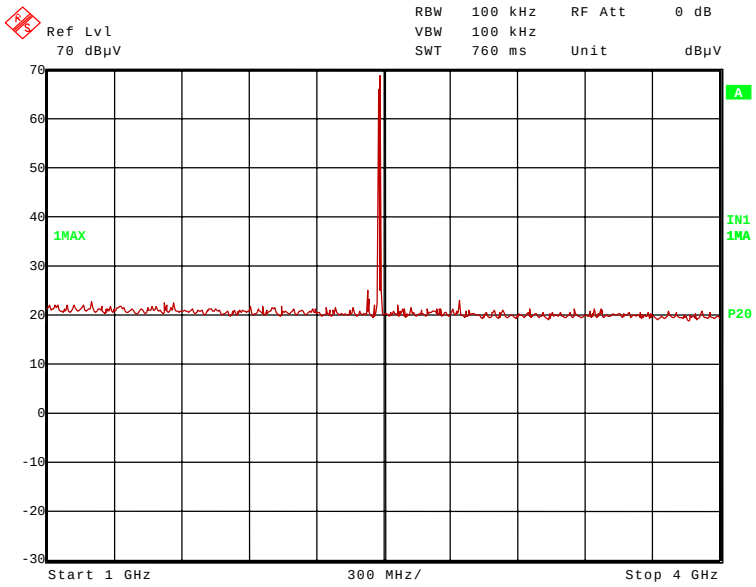
- 127.925 MHz and 253.494 MHz.

The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

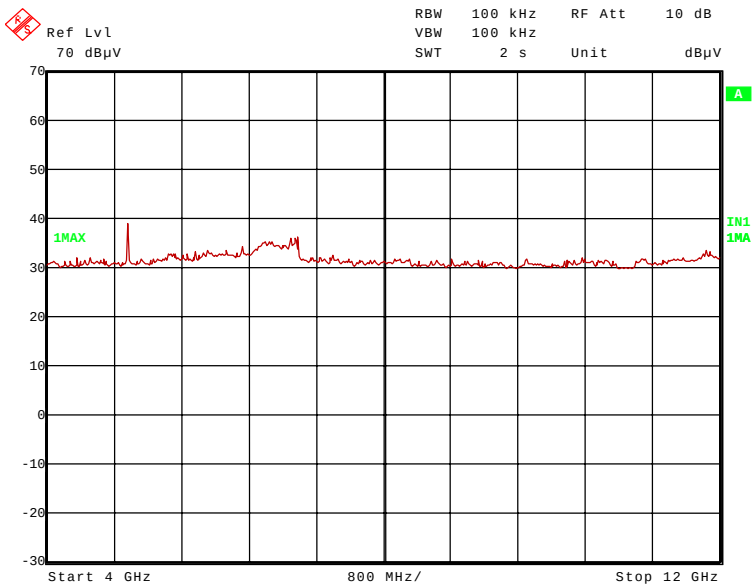
- 52.580 MHz, 90.257 MHz, 197.022 MHz and 312.375 MHz.

These frequencies have to be measured on the open area test site. The results were presented in the following.

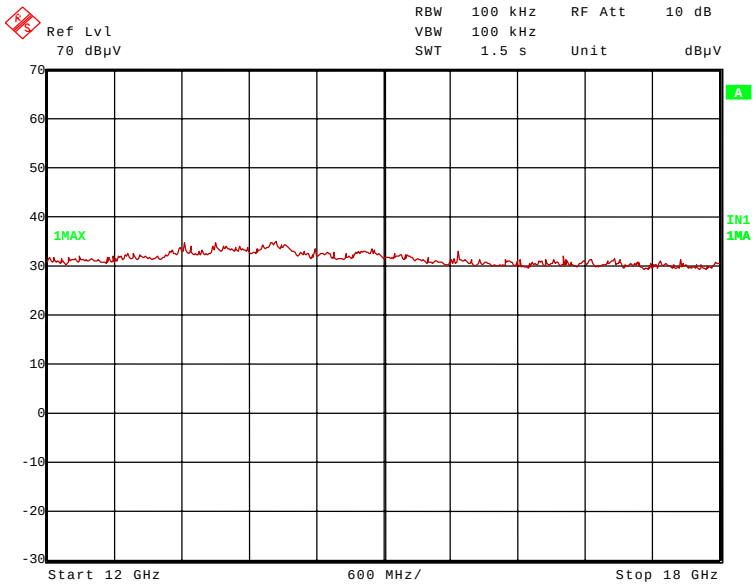
145554_6.wmf: Spurious emissions from 1 GHz to 4 GHz:



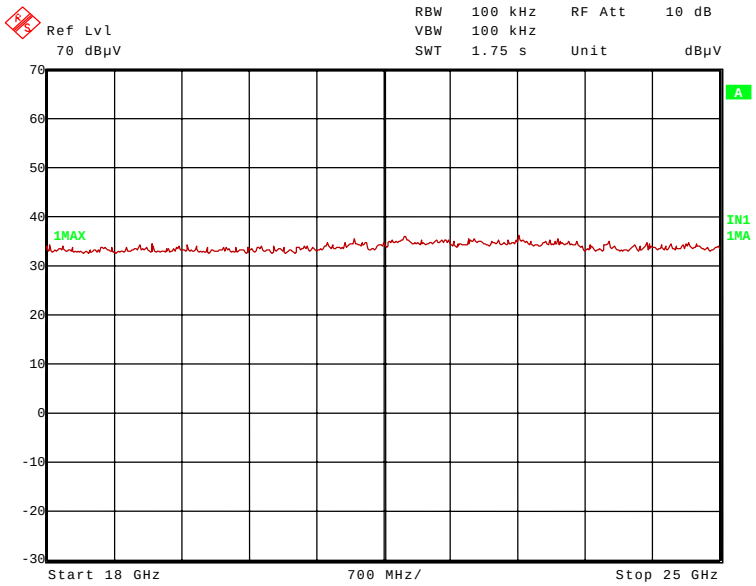
145554_8.wmf: Spurious emissions from 4 GHz to 12 GHz:



145554_9.wmf: Spurious emissions from 12 GHz to 18 GHz:



145554_10.wmf: Spurious emissions from 18 GHz to 25 GHz:



The following frequency was found inside the restricted bands during the preliminary radiated emission test:

- 4964.172 MHz.

The following frequency was found outside the restricted bands during the preliminary radiated emission test:

- 2482.086 MHz.

These frequencies have to be measured in a final measurement. The results were presented in the following.

Test equipment used (refer clause 6):

8, 29, 31 – 39, 43 – 45, 49 – 51, 53, 60, 61

5.1.3 Final radiated emission test (30 MHz to 1 GHz)

Ambient temperature:	21 °C

Relative humidity:	57 %

Position of EUT: The EUT was set-up on a wooden table of a height of 0.8 m.

Cable guide: The cable of the EUT was fixed on the non-conducting table. For further information of the cable guide refer to the pictures in annex A of this test report.

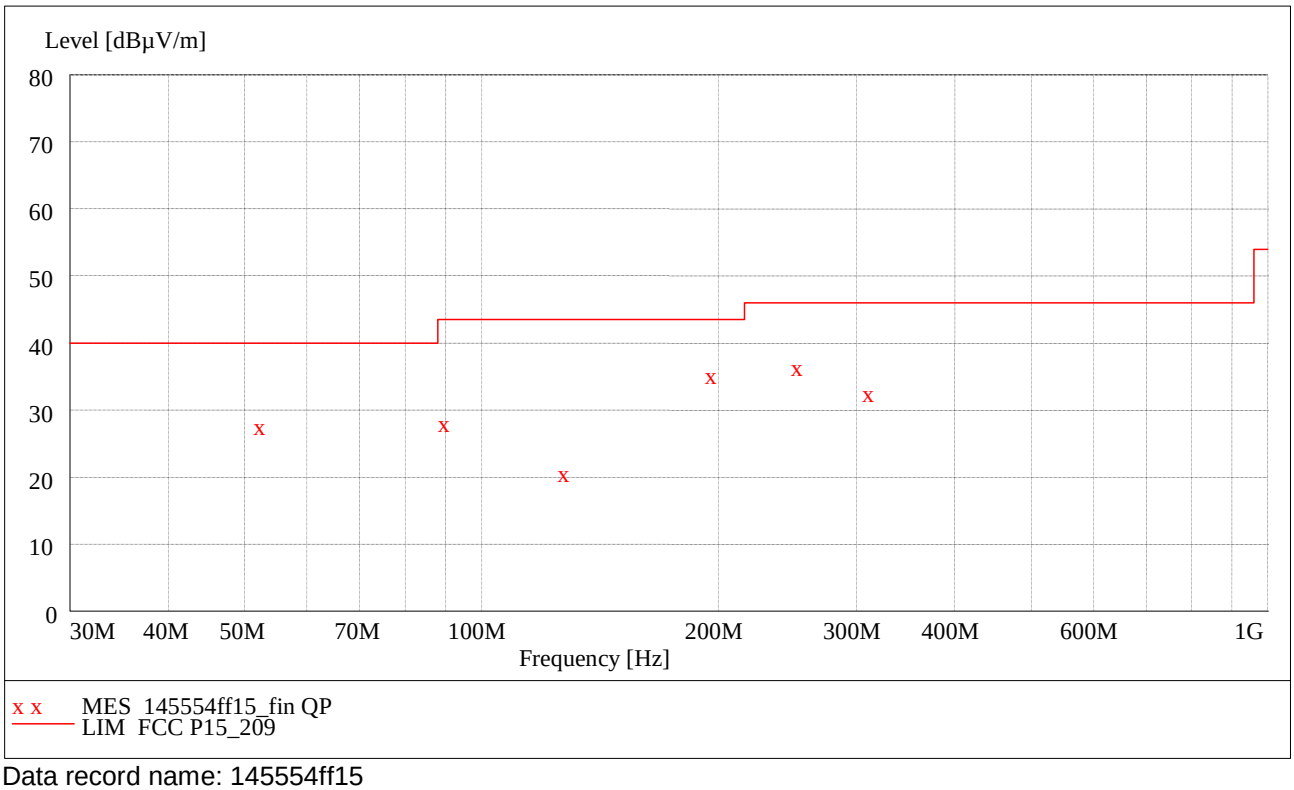
Test record: The test was carried out in normal operation mode of the EUT (refer also clause 2 of this test report). All results are shown in the following.

Power supply: During this test the EUT was powered with 24 DC via wireless power transfer.

Test results: The test results were calculated with the following formula:

Result [dBµV/m] = reading [dBµV] + cable loss [dB] + antenna factor [dB/m]

The measured points and the limit line in the following diagram refer to the standard measurement of the emitted interference in compliance with the above mentioned standard. The measured points marked by an x are the measured results of the standard subsequent measurement on the open area test site.



Data record name: 145554ff15

The results of the standard subsequent measurement on the open area test site are indicated in the table below. The limits as well as the measured results (levels) refer to the above mentioned standard while taking account of the specified requirements for a 3 m measuring distance.

Result measured with the quasi-peak detector:
(These values are marked in the above diagram by an x)

Spurious emissions in restricted bands									
Frequency MHz	Result dBµV/m	Limit dBµV/m	Margin dB	Readings dBµV	Antenna factor dB/m	Cable loss dB	Height cm	Azimuth deg	Pol.
127.925	21.0	43.5	22.5	7.4	12.3	1.3	276	90	Vert.
253.494	36.8	46.0	9.2	22.6	12.4	1.8	105	120	Hor.
Spurious emissions outside restricted bands									
Frequency MHz	Result dBµV/m	Limit dBµV/m	Margin dB	Readings dBµV	Antenna factor dB/m	Cable loss dB	Height cm	Azimuth deg	Pol.
52.580	28.0	40.0	12.0	19.3	7.9	0.8	175	123	Vert.
90.257	28.5	43.5	15.0	17.5	9.9	1.1	175	180	Hor.
197.022	35.7	43.5	7.8	25.3	8.9	1.5	113	225	Hor.
312.375	32.9	46.0	13.1	18.0	13.0	1.9	100	222	Hor.
Measurement uncertainty				+2.2 dB / -3.6 dB					

Test: Passed

Test equipment used (refer clause 6):

8, 14 - 20

5.1.4 Final radiated emission measurement (1 GHz to 25 GHz)

Ambient temperature:	22 °C	Relative humidity:	52 %

Position of EUT: The EUT was set-up on a wooden table of a height of 0.8 m.

Cable guide: The cable of the EUT was fixed on the non-conducting table. For further information of the cable guide refer to the pictures in annex A of this test report.

Test record: The test was carried out in normal operation mode of the EUT (refer also clause 2 of this test report). All results are shown in the following.

Power supply: During this test the EUT was powered with 24 DC via wireless power transfer.

Resolution bandwidth: For all measurements a resolution bandwidth of 1 MHz was used.

Test results: The test results were calculated with the following formula:

Result [dBµV/m] = reading [dBµV] + cable loss [dB] + antenna factor [dB/m] – preamplifier gain [dB]

Result measured with the peak detector:

Frequency MHz	Result dBµV/m	Limit dBµV/m	Margin dB	Readings dBµV	Antenna factor 1/m	Preamp dB	Cable loss dB	Height cm	Pol.	Restr. Band
2482.086	73.7	74.0	0.2	68.0	28.5	25.7	2.9	150	Hor.	Carrier
4964.172	58.8	74.0	15.2	46.6	33.0	25.3	4.5	150	Hor.	Yes
Measurement uncertainty							+2.2 dB / -3.6 dB			

Result measured with the average detector:

Frequency MHz	Result dBµV/m	Limit dBµV/m	Margin dB	Readings dBµV	Antenna factor 1/m	Preamp dB	Cable loss dB	Height cm	Pol.	Restr. Band
2482.086	48.6	54.0	5.3	42.9	28.5	25.7	2.9	150	Hor.	carrier
4964.172	39.1	54.0	14.9	26.9	33.0	25.3	4.5	150	Hor.	Yes
Measurement uncertainty							+2.2 dB / -3.6 dB			

Test: Passed

8 List of annexes

Annex A	**TEST SETUP PHOTOGRAPHS**:	**6 pages**
	RXM030S012PNP8A and TXM030S012PNP8A, test set-up fully anechoic chamber	145554_1.JPG
	RXM030S012PNP8A and TXM030S012PNP8A, test set-up fully anechoic chamber	145554_2.JPG
	RXM030S012PNP8A and TXM030S012PNP8A, test set-up fully anechoic chamber	145554_3.JPG
	RXM030S012PNP8A and TXM030S012PNP8A, test set-up fully anechoic chamber	145554_4.JPG
	RXM030S012PNP8A and TXM030S012PNP8A, test set-up fully anechoic chamber	145554_5.JPG
	RXM030S012PNP8A and TXM030S012PNP8A, test set-up open area test site	145554_8.JPG
Annex B	**EXTERNAL PHOTOGRAPHS**:	**3 pages**
	RXM030S012PNP8A, front view	145554_t.JPG
	RXM030S012PNP8A, side view	145554_u.JPG
	RXM030S012PNP8A, rear view	145554_w.JPG
Annex C	**INTERNAL PHOTOGRAPHS**:	**4 pages**
	RXM030S012PNP8A, internal view	145554_b.JPG
	RXM030S012PNP8A, PCB, top view	145554_e.JPG
	RXM030S012PNP8A, PCB, bottom view	145554_g.JPG
	RXM030S012PNP8A, antenna view	145554_i.JPG
Annex D	**ADDITIONAL RESULTS FOR INDUSTRY CANADA**:	**3 pages**
