0 Summary

0.1 Technical Report Summary

Type of Authorization

Certification for an Intentional Radiator (Periodic operation in the band above 70 MHz)

Applicable FCC Rules

Edition of FCC Rules: 10-1-13

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 2 and 15. The following subparts are applicable to the results in this test report.

Part 2, Subpart J - Equipment Authorization Procedures, Certification

Part 15, Subpart C – Intentional Radiators

§ 15.201 Equipment authorization requirement

§ 15.207 Conducted limits

§ 15.209 Radiated emission limits; general requirements

§ 15.231 Periodic operation in the band 40.66-40.70 MHz, above 70 MHz

Note:
none

Summary Test Results:

The EUT complied with all performed tests as listed in chapter 0.2 Measurement Summary.

0.2 Measurement Summary

FCC Part 15, Subpart C § 15.207

Conducted emissions (AC power line)

The measurement was performed according to ANSI C63.4

| OP-Mode | Setup | Port | 2009 Final Result |
|---------|-------|----------------------|----------------------|
| | | AC Port (power line) | N/A |

FCC Part 15, Subpart C § 15.231

Duty cycle measurement (based on dwell time measurement)

The measurement was performed according to FCC § 15.31

| OP-Mode | Setup | Port | 10-1-13 Edition Final Result |
|-----------|----------|-----------------------------|---------------------------------|
| op-mode 1 | Setup_02 | Temporary antenna connector | passed |

FCC Part 15, Subpart C § 15.231

Spurious Radiated Emissions

The measurement was performed according to ANSI C63.4

| OP-Mode | Setup | Port | 2009 Final Result |
|-----------|----------|-----------|----------------------|
| op-mode 2 | Setup_01 | Enclosure | passed |

FCC Part 15, Subpart C § 15.231

Peak power output

The measurement was performed according to ANSI C63.4

| OP-Mode | Setup | Port | 2009 Final Result |
|-----------|----------|-----------|----------------------|
| op-mode 2 | Setup_01 | Enclosure | passed |

FCC Part 15, Subpart C § 15.231

Occupied Bandwidth

The measurement was performed according to FCC § 15.31

| OP-Mode | Setup | Port | 10-1-13 Edition Final Result |
|-----------|----------|-----------|---------------------------------|
| op-mode 2 | Setup_01 | Enclosure | passed |

N/A not applicable (the EUT is powered by DC internal battery)

1 Administrative Data

1.1 Testing Laboratory

Company Name: 7Layers AG
Address: Borsigstr. 11
40880 Ratingen
Germany

This facility has been fully described in a report submitted to the FCC and accepted under the registration number 96716.

The test facility is also accredited by the following accreditation organisation:
Laboratory accreditation no.: DAKkS D-PL-12140-01-01

Responsible for Accreditation Scope: Dipl.-Ing. Bernhard Retka
Dipl.-Ing. Robert Machulec
Dipl.-Ing. Andreas Petz
Dipl.-Ing. Marco Kullik

Report Template Version: 2012-03-14

1.2 Project Data

Responsible for testing and report: Dipl.-Ing. Dobrin Dobrinov
Date of Test(s): 2014-10-08 to 2014-10-20
Date of Report: 2014-12-11

1.3 Applicant Data

Company Name: ICP Systems b.v.
Address: Handelsweg 48
7451PJ Holten
Netherlands
Contact Person: Mr. Philipp Rasche

2 Test object Data

2.1 General EUT Description

| | |
|--|---------------------|
| Equipment under Test | Icarus |
| Type Designation: | TxHeavy |
| Kind of Device: | 433 MHz transmitter |
| (optional) | |
| Voltage Type: | DC internal battery |
| Voltage level: | 9.0 V |
| Repeated Operation: | Manually |
| The EUT is part of a security or safety system: | No |

General product description:

The Equipment Under Test (EUT) is a wireless handheld remote control unit transmitter for non-periodic operation in the band above 70 MHz. The operating frequency is in the 433 MHz ISM band.

Specific product description for the EUT:

None

The EUT provides the following ports:

Ports

- Enclosure

The main components of the EUT are listed and described in Chapter 2.2.

2.2 EUT Main components

Type, S/N, Short Descriptions etc. used in this Test Report

| Short Description | Equipment under Test | Type Designation | Serial No. | HW Status | SW Status | Date of Receipt |
|------------------------------------|----------------------|------------------|------------|--------------|--|-----------------|
| EUT A (Code: DE10 66000aa01) | Icarus | TxHeavy | 14.000.187 | 9237930 6 | 21.047.214 continuous CW/CM (for test purpose only) | - |

Remark: EUT A is equipped with an integral antenna (gain = -16 dBi).

NOTE: The short description is used to simplify the identification of the EUT in this test report.

2.3 Ancillary Equipment

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational and control features to the EUT. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Ancillary Equipment can influence the test results.

| Short Description | Equipment under Test | Type Designation | HW Status | SW Status | Serial no. | FCC ID |
|-------------------|----------------------|------------------|-----------|-----------|------------|--------|
| - | - | - | - | - | - | - |

2.4 Auxiliary Equipment

For the purposes of this test report, auxiliary equipment is defined as equipment which is used temporarily to enable operational and control features especially used for the tests of the EUT which is not used during normal operation or equipment that is used during the tests in combination with the EUT but is not subject of this test report. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Auxiliary Equipment can influence the test results.

| Short Description | Equipment under Test | Type Designation | HW Status | SW Status | Serial no. | FCC ID |
|-------------------|----------------------|------------------|-----------|-----------|------------|--------|
| - | - | - | - | - | - | - |

2.5 EUT Setups

This chapter describes the combination of EUTs and ancillary equipment used for testing.

| Setup No. | Combination of EUTs | Description |
|-----------|---------------------|--|
| Setup_01 | EUT A | setup for Peak Power Output, Occupied Bandwidth and Spurious Radiated Emissions measurements |
| Setup_02 | EUT A | setup for Duty Cycle measurements |

2.6 Operating Modes

This chapter describes the operating modes of the EUTs used for testing.

| Op. Mode | Description of Operating Modes | Remarks |
|-----------|--------------------------------|--|
| op-mode 1 | normal operation | At each pressing of a button 6, transmitter is sending a pulse coded signal once. |
| op-mode 2 | continuous operation | Transmitter is sending continuously a CW or CM signal (after pressing buttons 4 or 3). Special op mode for test purpose only. |

2.7 Product labeling

2.7.1 FCC ID label

FCC ID: 2ADQ3ICARUSTXHEAVY

2.7.2 Location of the label on the EUT

Please refer to the documentation of the applicant.

3 Test Results

3.1 Duty cycle measurement (based on dwell time measurement)

Standard FCC Part 15, 10-1-13 Edition Subpart C

The test was performed according to: FCC §15.35, §15.231

3.1.1 Test Description

The Equipment Under Test (EUT) was setup in a shielded room to perform the dwell time measurements. For analyzer settings please see measurement plots in annex.

3.1.2 Test Limits

Depending on the function of the EUT different paragraphs of FCC §15.231 apply:

Either

(a)(1): A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

Or

(a)(2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.

And

(a)(3) Periodic transmissions at regular predetermined intervals are not permitted. However, polling or supervision transmissions, including data, to determine system integrity of transmitters used in security or safety applications are allowed if the total duration of transmissions does not exceed more than two seconds per hour for each transmitter. There is no limit on the number of individual transmissions, provided the total transmission time does not exceed two seconds per hour.

Otherwise

(e) Intentional radiators may operate at a periodic rate exceeding that specified in paragraph (a) of this section and may be employed for any type of operation [...]. In addition, [...] the duration of each transmission shall not be greater than one second and the silent period between transmissions shall be at least 30 times the duration of the transmission but in no case less than 10 seconds.

This test is also performed to determine the pulse train of the transmitter and calculate the correction factor for pulse modulated transmitters according to FCC §15.35. This factor is used as a correction factor for the field strength measurements, both for Spurious radiated emissions and Peak power output.

3.1.3 Test Protocol

Temperature: °C
Air Pressure: hPa
Humidity: %

| Op. Mode | Setup | Port |
|-----------|----------|-----------------------------|
| op-mode 1 | Setup_02 | Temporary antenna connector |

a) Determine the total duration of a transmission within 100 ms:

Duty cycle = $(L1 \cdot N1) + (L2 \cdot N2) + \dots + (Ln \cdot Nn) / 100 \text{ ms}$ or T, whichever is less
Correction factor = $20 \cdot \text{LOG}(\text{Duty cycle}) [\text{dB}]$

| | | |
|--------|--|--------------|
| Step 1 | Holdover time | Less than 5s |
| Step 2 | Cycle to determine the on/off ratio within a cycle (period T) | 872 ms |
| Step 3 | Sweep of a data word to determine the on time within a data word (L1-LN). | L1 = 20.3 ms |
| Step 4 | Determine the number of pulses (N1-NN). First range (trigger delay = -10 ms). | N1 = 2 |

Calculation of Duty Cycle / Correction Factor:

If $T > 100 \text{ ms} \Rightarrow T = 100 \text{ ms}$; $L1 = 20.3 \text{ ms}$; $N1 = 2$;

In 100 ms $T_{\text{on}} = 2 \cdot 20.3 \text{ ms} = 40.6 \text{ ms}$

Duty cycle = $40.6 / 100 = 0.406$

Correction factor = $20 \cdot \text{LOG}(0.406) = -7.8 \text{ dB}$

b) Determine the period of periodic re-transmission, if any, or cease (deactivation) time:

Period of retransmission T_R . There is no periodic retransmission. After pressing a button, the EUT sends only one pulse train.

Deactivation after $T_c = 0.872 \text{ s}$, Limit: $\leq 5 \text{ s}$

c) Determine the total duration of periodic transmissions within 1 hour, if any:

Duration t_d of all pulses/bursts during T_R ("on-time"):

$t_d = 18 \cdot L1 = 18 \cdot 20.3 = 365.4 \text{ ms}$

d) If the result of c) exceeds 2 seconds/hour then paragraph (e) applies:

Determine the duration of each transmission (one complete pulse train) and silent time:

Duration t_{PT} , Limit: $\leq 1 \text{ s}$ (Remark: t_{PT} is identical to t_d if $T \leq 100 \text{ ms}$)

Silent time between transmissions $t_s =$, Limit: $\leq \text{Maximum}(10 \text{ s and } 30 \cdot t_{PT})$.

3.1.4 Test result: Duty cycle / correction factor

| FCC Part 15, Subpart C | Op. Mode | Result |
|------------------------|-----------|--------|
| | op-mode 1 | passed |

3.2 Spurious radiated emissions

Standard FCC Part 15, 10-1-13 Edition Subpart C

The test was performed according to: FCC §15.31, ANSI C 63.4, 2009

3.2.1 Test Description

The test set-up was made in accordance to the general provisions of ANSI C 63.4-2009. The Equipment Under Test (EUT) was set up on a non-conductive table 1.0 x 2.0 m in the semi-anechoic chamber. The test was performed at the distance of 3 m between the EUT and the receiving antenna.

The radiated emissions measurements were made in a typical installation configuration. The measurement procedure is implemented into the EMI test software ES-K1 from R&S.

1. Measurement up to 30 MHz

The test set-up was made in accordance to the general provisions of ANSI C 63.4-2009. The Equipment Under Test (EUT) was set up on a non-conductive table in the anechoic chamber.

The radiated emissions measurements were made in a typical installation configuration. The measurement procedure is implemented into the EMI test software ES-K1 from R&S. The Loop antenna HFH2-Z2 is used.

Step 1: pre measurement

- Anechoic chamber
- Antenna distance: 10 m
- Detector: Peak-Maxhold
- Frequency range: 0.009 – 0.15 and 0.15 – 30 MHz
- Frequency steps: 0.1 kHz and 5 kHz
- IF-Bandwidth: 0.2 kHz and 10 kHz
- Measuring time / Frequency step: 10 ms

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

Step 2: final measurement

For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is to find the maximum emission level.

- Open area test side
- Antenna distance: according to the Standard
- Detector: Quasi-Peak
- Frequency range: 0.009 – 30 MHz
- Frequency steps: measurement at frequencies detected in step 1
- IF-Bandwidth: 200 Hz - 10 kHz
- Measuring time / Frequency step: 100 ms

2. Measurement above 30 MHz and up to 1 GHz

Step 1: Preliminary scan

Preliminary test to identify the highest amplitudes relative to the limit.

Settings for step 1:

- Detector: Peak-Maxhold
- Frequency range: 30 – 1000 MHz
- Frequency steps: 60 kHz
- IF-Bandwidth: 120 kHz
- Measuring time / Frequency step: 100 µs

- Turntable angle range: -180 to 180°
- Turntable step size: 90°
- Height variation range: 1 – 3 m
- Height variation step size: 2 m
- Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

Step 2: second measurement

For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is, to find out the approximate turntable angle and antenna height for each frequency.

- Detector: Peak – Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100 ms
- Turntable angle range: -180 to 180°
- Turntable step size: 45°
- Height variation range: 1 – 4 m
- Height variation step size: 0.5 m
- Polarisation: horizontal + vertical

After this step the EMI test system has determined the following values for each frequency (of step 1):

- Frequency
- Azimuth value (of turntable)
- Antenna height

The last two values have now the following accuracy:

- Azimuth value (of turntable): 45°
- Antenna height: 0.5 m

Step 3: final measurement

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency, which was determined the turntable azimuth and antenna height will be adjusted. The turntable azimuth will be slowly varied by $\pm 22.5^\circ$ around this value. During this action the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position the antenna height is also slowly varied by ± 25 cm around the antenna height determined. During this action the value of emission is also continuously measured. The antenna height of the highest emission will also be recorded and adjusted.

- Detector: Peak – Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100 ms
- Turntable angle range: -22.5° to $+22.5^\circ$ around the determined value
- Height variation range: -0.25 m to $+0.25$ m around the determined value

Step 4: final measurement with QP detector

With the settings determined in step 3, the final measurement will be performed:

EMI receiver settings for step 4:

- Detector: Quasi-Peak(< 1 GHz)
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 1 s

3. Measurement above 1 GHz

The following modifications apply to the measurement procedure for the frequency range above 1 GHz:

The measurement distance was reduced to 1 m. The results were extrapolated by the extrapolation factor of 20 dB/decade (inverse linear distance for field strength measurements, inverse linear-distance squared for the power reference level measurements). Due to the fact that in this frequency range a double ridged wave guided horn antenna (up to 18 GHz) and a horn antenna (18-25 GHz) are used, the steps 2-4 are omitted. Step 1 was performed with one height of the receiving antenna only.

Important EMI receiver settings:

- Detector: Peak, Average
- RBW = 1 MHz, VBW = 3 MHz
- Sweep time = 100 ms / per 100 MHz sweep

3.2.2 Test Requirements / Limits

1) A radiated emission test is relating to the fundamental frequency.

a) Either for "non-periodic" operation of the EUT as defined in §15.231(a) the limits for the average field strength apply according to FCC Part 15, Subpart C, §15.231(b):

| For fundamental frequency (MHz) | Limit Fundamental (dBµV/m) | Limit Spurious (dBµV/m) |
|---------------------------------|----------------------------|-------------------------|
| 40.66 – 40.70 | 67.0 | 47.0 |
| 70 – 130 | 67.0 | 47.0 |
| 130 – 174 | 67.0 – 71.5 | 47.0 – 51.5 *) |
| 174 – 260 | 71.5 | 51.5 |
| 260 – 470 | 71.5 – 81.9 | 51.5 – 61.9 *) |
| above 470 | 81.9 | 61.9 |

b) Or for "periodic" operation of the EUT the limits for the average field strength apply according to FCC Part 15, Subpart C, §15.231(e):

| For fundamental frequency (MHz) | Limit Fundamental (dBµV/m) | Limit Spurious (dBµV/m) |
|---------------------------------|----------------------------|-------------------------|
| 40.66 – 40.70 | 60.0 | 40.0 |
| 70 – 130 | 54.0 | 34.0 |
| 130 – 174 | 54.0 – 63.5 | 34.0 – 43.5 *) |
| 174 – 260 | 63.5 | 43.5 |
| 260 – 470 | 63.5 – 74.0 | 43.5 – 54.0 *) |
| above 470 | 74.0 | 54.0 |

*) linear interpolation

2) A radiated emission test applies to harmonic/spurs that fall in the restricted bands as listed in § 15.205(a). The maximum permitted QP (< 1 GHz) and Average (> 1GHz) field strength is listed in § 15.209(a):

Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

| Frequency in MHz | Limit (µV/m) | Measurement distance (m) | Calculate Limit(dBµV/m @10m) | Limit (dBµV/m) @10m |
|------------------|---------------|--------------------------|------------------------------|---------------------|
| 0.009 – 0.49 | 2400/F (kHz) | 300 | (48.5 – 13.8) + 59.1 dB | 107.6 – 77.9 |
| 0.49 – 1.705 | 24000/F (kHz) | 30 | (48.9 – 23.0) + 19.1 dB | 68.0 – 42.1 |
| 1.705 – 30 | 30 | 30 | 29.5 + 19.1 dB | 48.6 |

| Frequency in MHz | Limit (µV/m) | Measurement distance (m) | Limit (dBµV/m) |
|------------------|--------------|--------------------------|----------------|
| 30 – 88 | 100 | 3 | 40.0 |
| 88 – 216 | 150 | 3 | 43.5 |
| 216 – 960 | 200 | 3 | 46.0 |
| above 960 | 500 | 3 | 54.0 |

§15.35(b) ..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit

Used conversion factor: $\text{Limit (dBµV/m)} = 20 \log (\text{Limit (µV/m)}/1\mu\text{V/m})$

§15.35(c):

[...] when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds.

As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted [...].

§15.231(b)(3)

The limits on the field strength of the spurious emissions in the above table are based on the fundamental frequency of the intentional radiator.

Spurious emissions shall be attenuated to the average (or, alternatively, CISPR quasi-peak) limits shown in this table or to the general limits shown in §15.209, whichever limit permits a higher field strength.

Interpretation of the test laboratory:

The lats subordinate clause of §15.231(b)(3) is overruled by §15.205/209, therefore within the restricted bands the limits defined at §15.205/209 and outside the restricted bands the limits defined at §15.231(b) resp. §15.231(e) are applied.

3.2.3 Test Protocol

3.2.3.1 Measurement up to 30 MHz

Temperature: 24 °C
Air Pressure: 1009 hPa
Humidity: 38 %

| Op. Mode | Setup | Port |
|-----------|----------|-----------|
| op-mode 2 | Setup_01 | Enclosure |

| Polari-sation | Frequency MHz | Corrected value dBµV/m | | | Limit dBµV/m | Limit dBµV/m | Limit dBµV/m | Margin to limit dB | Margin to limit dB |
|---------------|------------------|---------------------------|------|----|-----------------|-----------------|-----------------|--------------------------|--------------------------|
| | | QP | Peak | AV | QP | Peak | AV | QP/Peak | AV |
| channel 1 | | | | | | | | | |
| 0° | - | - | - | - | - | - | - | - | - |
| 90° | - | - | - | - | - | - | - | - | - |
| channel 6 | | | | | | | | | |
| 0° | - | - | - | - | - | - | - | - | - |
| 90° | - | - | - | - | - | - | - | - | - |

Remark: In step 1 no spurious emissions above the limit were found using a peak detector, therefore step 2 (using a QP-detector) was not performed. Please see the measurement plots in annex.

All the Spurious radiated emissions measurements are done at the lowest and highest carrier frequencies the EUT operates on, resp. channel 1 and channel 6. All three axis (Y,Y,Z) of the device and both antenna polarizations (H/V) were considered.

3.2.3.2 Measurement 30 MHz – 1 GHz

Temperature: 24 °C
Air Pressure: 1006 hPa
Humidity: 42 %

| Op. Mode | Setup | Port |
|-----------|----------|-----------|
| op-mode 2 | Setup_01 | Enclosure |

| Polarisation of the antenna and the EUT | Frequency MHz | Corrected value dBµV/m | | | Limit dBµV/m | Limit dBµV/m | Limit dBµV/m | Margin to limit dB | Margin to limit dB |
|---|---------------|------------------------|------|----|--------------|--------------|--------------|--------------------|--------------------|
| | | QP | Peak | AV | QP | Peak | AV | QP/Peak | AV |
| channel 1 | | | | | | | | | |
| - | - | - | - | - | - | - | - | - | - |
| channel 6 | | | | | | | | | |
| - | - | - | - | - | - | - | - | - | - |

Remark: No spurious emissions in the range 20 dB below the limit found. The test was performed in the frequency range from 30 MHz to 1 GHz. For this test an EUT sending a CW signal was used.

All the Spurious radiated emissions measurements are done at the lowest and highest carrier frequencies the EUT operates on, resp. channel 1 and channel 6. All three axis (Y,Y,Z) of the device and both antenna polarizations (H/V) were considered.

3.2.3.3 Measurement above 1 GHz

Temperature: 24 °C
 Air Pressure: 1006 hPa
 Humidity: 42 %

| Op. Mode | Setup | Port |
|-----------|----------|-----------|
| op-mode 2 | Setup_01 | Enclosure |

| Polarisation | Frequency MHz | Corrected value dBµV/m | | | Limit dBµV/m | Limit dBµV/m | Limit dBµV/m | Margin to limit dB | Margin to limit dB |
|--------------|---------------|------------------------|------|----|--------------|--------------|--------------|--------------------|--------------------|
| | | QP | Peak | AV | QP | Peak | AV | QP/Peak | AV |
| channel 1 | | - | | | - | | | | |
| channel 6 | | - | | | - | | | | |

Remarks: No spurious emissions in the range 20 dB below the limit found. The test was performed in the frequency range from 1 GHz to 4.5 GHz. For this test an EUT sending a CW signal was used.

All the Spurious radiated emissions measurements are done at the lowest and highest carrier frequencies the EUT operates on, resp. channel 1 and channel 6. All three axis (Y,Y,Z) of the device and both antenna polarizations (H/V) were considered.

3.2.4 Test result: Spurious radiated emissions

| FCC Part 15, Subpart C | Op. Mode | Result |
|------------------------|-----------|--------|
| | op-mode 2 | passed |

3.3 Peak power output

Standard FCC Part 15, 10-1-13 Edition Subpart C

The test was performed according to: FCC §15.31, §15.231, ANSI C 63.4, 2009

3.3.1 Test Description

Please refer to sub-clause 3.2.1.

3.3.2 Test Limits

Please refer to sub-clause 3.2.2.

3.3.3 Test Protocol

Temperature: 24 °C
Air Pressure: 1009 hPa
Humidity: 38 %

| Op. Mode | Setup | Port |
|-----------|----------|-----------|
| op-mode 2 | Setup_01 | Enclosure |

| channel | Output power dBμV/m | Frequency MHz | Limit dBμV/m | Remarks |
|---------|------------------------|------------------|-----------------|---|
| 1 | 72.3 | 433.2 | 80.81 | Maximum radiated field strength at fundamental frequency |
| 4 | 72.4 | 434.1 | 80.83 | |
| 6 | 75.0 | 434.7 | 80.85 | |

Note: The maximal peak power output values shown in the table above are corrected by using the Duty Cycle Correction Factor, calculated in 3.1.3.

3.3.4 Test result: Peak power output

| FCC Part 15, Subpart C | Op. Mode | Result |
|------------------------|-----------|--------|
| | op-mode 2 | passed |

3.4 Occupied bandwidth

Standard FCC Part 15, 10-1-13 Edition Subpart C

The test was performed according to: FCC §15.231

3.4.1 Test Description

The Equipment Under Test (EUT) was setup in a shielded room to perform the occupied bandwidth measurements.

For analyzer settings please see the measurement plots in annex.

3.4.2 Test Limits

FCC Part 15, Subpart C, §15.231(c)

The maximum 20 dB bandwidth of a transmitter operating at a frequency range:

70 to 900 MHz is 0.25% of the centre frequency

above 900 MHz is 0.5% of the centre frequency

3.4.3 Test Protocol

Temperature: 23 °C

Air Pressure: 1009 hPa

Humidity: 42 %

| Op. Mode | Setup | Port |
|-----------|----------|-----------|
| op-mode 2 | Setup_01 | Enclosure |

| Channel | 20 dB bandwidth kHz | 99% bandwidth kHz | Limit kHz | Remarks |
|---------|---------------------|-------------------|-----------|---|
| 1 | 196.393 | 285.571 | 1086.75 | The limit is calculated as: 434.7 MHz (the maximal carrier frequency used) * 0.25% = = 1086.75 kHz. |
| 4 | 179.359 | 260.521 | 1086.75 | |
| 6 | 192.385 | 249.499 | 1086.75 | |

Remark: The analyser settings are consistent with the recommendations of ANSI C63.10-2013 section 6.9.2 where is stated, that the resolution bandwidth should be between 1% and 5% of the actual signal bandwidth.

As an actual signal bandwidth the limit of 1086.75 kHz is considered. According to ANSI C63.10-2013 section 6.9.2, the analyser RBW should be between 10.868 kHz and 54.338 kHz. The RBW of 30 kHz was chosen.

Please see annex for the measurement plots.

3.4.4 Test result: Occupied bandwidth

| FCC Part 15, Subpart C | Op. Mode | Result |
|------------------------|-----------|--------|
| | op-mode 2 | passed |

4 Test Equipment

The calibration, hardware and software states are shown for the testing period.
