A client device is defined as a device operating in a mode in which the transmissions of the device are under					
control of the master. A device in client mode is not able to initiate a network.					
(5) For client devices that have software configuration control to operate in different modes (active scanning					
in some and passive scanning in others) in different bands (devices with multiple equipment classes or those					
that operate on non-DFS frequencies) or modular devices which configure the modes of operations through					
software, the application must provide software and operations description on how the software and / or					
hardware is implemented to ensure that proper operations modes cannot be modified by end user or an installer.
