## 1. INTRODUCTION

This report presents the results of partial radio test carried out on the following radio equipment: **Skycontroller UKR model 'MPP U2'**, in accordance with normative reference.

The equipment under test integrates:

- Proprietary protocol MARS 2.4 GHz transceiver radio function not already certified,
- Lora transceiver radio part module already certified referenced '**LBAA0QB1SJ**', (FCC ID: VPYLBAA0QB1SJ / IC:772C-LBAA0QB1SJ).
- GNSS multifrequencies receiver.

This report concerns only Proprietary protocol MARS 2.4 GHz radio part.

The applicant declared that this radio is not operational during charging mode.

Firstly, all tests were performed at the frequencies of 2407MHz, 2447MHz and 2477MHz and a power setting regulated to 16.

However, during the Band-Edge tests, we noticed this last test does not respected the standard.

So, we have reduced the power setting at 12 and retired 9 channels to respect Band-edge High Channel.

All tests were redone except:

- Occupied bandwidth,
- Radiated spurious emissions (more critical with the first parameters).

The host device of certified module(s) shall be properly labeled to identify the module(s) within.

**Test set up:** (Refer Appendix 2)

First an exploratory radiated measurement was performed.

During this phase the product is oriented in three orthogonal planes.

Then the final measurement is realized with the product on the most critical orientation.

The system is tested in anechoic chamber, the EUT is placed on a rotating table, 1.5 m from a ground plane.

See test setup in appendix 2.

**Distance of antenna:** 3 meters**Antenna height:** 1 to 2.20 m (0.5 m above the top of the EUT)**Antenna polarization:** vertical and horizontal (only the highest level is recorded)

The measurement of the radiated electro-magnetic field is realized with an analyser and peak detector. The resolution bandwidth is adjusted at 10 MHz and video bandwidth at 10 MHz. (11.9.1.1 of ANSI C63.10)

Finally the radiated electro-magnetic field is converted in dBm with the following formula:

$$EIRP(dBm) = E \text{ (dB}\mu\text{V/m)} + 20\log(D) - 104.8;$$
where D is the measurement distance in meters and antenna Gain = 8 dBi.**Equipment under test operating condition:**

#### Band edge worst case measurement (band 2.31GHz to 2.39GHz)

**Applicable limits:** In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The highest level recorded in a 100 kHz bandwidth is 106 dBμV/m on low channel.

So the applicable limit is 86 dBμV/m.

In addition, radiated emissions which fall in the restricted band, as defined in section 15.205 (a), must also comply with the radiated emission limits specified in section 15.209 (a) (see section 15.205 (c)).

In addition, radiated emissions which fall in the restricted band, as defined in Table 6 of RSS-Gen, must also comply with the radiated emission limits specified in Table 4 and Table 5 of RSS-Gen.

For FCC Part 15: paragraph 15.247 (e), paragraph 15.247 (f)

For RSS-247: paragraph 5.2

PKPSD (Peak PSD) method of paragraph 11.10.2 of ANSI C63.10

**Test set up:** (Refer Appendix 2)

First an exploratory radiated measurement was performed.

During this phase the product is oriented in three orthogonal planes.

Then the final measurement is realized with the product on the most critical orientation.

The system is tested in anechoic chamber, the EUT is placed on a rotating table, 1.5 m from a ground plane.

Zero degree azimuths correspond to the front of the device under test.

See test setup in appendix 2

**Distance of antenna:** 3 meters (in anechoic room)**Antenna height:** 1 to 2.20 meters (0.5 m above the top of the EUT) in anechoic room**Antenna polarization:** vertical and horizontal (only the highest level is recorded)

The measurement of the radiated electro-magnetic field is realized with an analyser.

Span:	14 MHz
Resolution bandwidth:	3 kHz
Video bandwidth:	10 kHz
Detector:	Peak
Number of points:	2001
Sweep time:	Auto
Trace mode:	Max Hold

Then the peak marker function is used.

Finally the radiated electro-magnetic field is converted in dBm with the following formula:

$$\text{EIRP(dBm)} = E \text{ (dB}\mu\text{V/m)} + 20\log(D) - 104.8;$$
where D is the measurement distance in meters and antenna Gain = 8 dBi.

## Equipment under test operating condition:

The equipment under test is blocked in continuous modulated transmission mode, at the highest output power level at which the transmitter is intended to operate.

We used for power source the 7.2Vdc Li-ion Polymer internal battery fully charged of the equipment.

## Results:

Sample N° 1      Low Channel (F = 2407 MHz)

	Electro-magnetic field (dBμV/m):	Maximum Peak conducted power density(1) (dBm / 3 kHz)	Limit (dBm / 3 kHz)
Nominal supply voltage:	88.8	-14.43	8

Polarization of test antenna: horizontal (height: 100 cm)

Position of equipment: Position 3 - (azimuth: 180 degrees)

Maximum Peak conducted power density:

$EIRP(dBm / 3 kHz) = E (dBμV/m / 3 kHz) + 20\log(D) - 104.8$ ; where D is the measurement distance in meters and antenna Gain = 8 dBi.

Declared maximum antenna gain: 8 dBi

Sample N° 1 Central Channel (F = 2442 MHz)
