**MS3000-MT-450, FCC ID:2AG7UMS3000-450**  
**TX power tune-up procedure**

During production, each device (DUT) is going through the following procedure:

1. The DUT is programmed to transmit in maximum gain.
2. An external device is used to measure the TX power.
3. If the DUT transmits above the allowed limit or below a lower threshold, then the test fails and the DUT is not released.
4. In a case of such a failure, the DUT is sent to a technician for fixing, and then goes through the test again before being released.
