1. INTRODUCTION

This report presents the results of radio test carried out on the following radio equipment: **Toran'O**, in accordance with normative reference.

The device under test integrates a LoRa not certified function.

This radio report concerns only the test realized on FHSS band (125 kHz Bandwidth).

2. PRODUCT DESCRIPTION

Category of equipment (ISED): I

Class: B

Utilization: Residential

Antenna type and gain: Integral antenna (Maximum Gain : 5.92 dBi)

Operating frequency range: From 902 MHz to 928 MHz

Frequency tested: 902.3 MHz, 908.7 MHz, 914.9 MHz for transmission

Frequencies plan detailed transmitter:

Channel frequencies	LoRa bandwidth (KHz)	Number of channel	Channel width (KHz)
902,3+i*0,2MHz (i=0 à 63)	125	64	200

Number of channels: 64

Channel spacing: 200 kHz

Modulation: LoRa with spread factor 7 to 10

Power source: 3.6 Vdc LS17500 battery 3.6 Ah

During test the output power was adjusted at the maximal level with the following setting (13 dB).

Power level, frequency range and channels characteristics are not user adjustable.

The details pictures of the product and the circuit boards are joined with this file.

3. NORMATIVE REFERENCE

The standards and testing methods related throughout this report are those listed below.

They are applied on the whole test report even though the extensions (version, date and amendment) are not repeated.

4. TEST METHODOLOGY

Radio performance tests procedures given in CFR 47 part 15:

Subpart C – Intentional Radiators

- Paragraph 203: Antenna requirement
- Paragraph 205: Restricted bands of operation
- Paragraph 209: Radiated emission limits; general requirements
- Paragraph 212: Modular transmitter
- Paragraph 215: Additional provisions to the general radiated emission limitations
- Paragraph 247: Operation within the bands 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz

Radio performance tests procedures given in RSS-Gen:

- Paragraph 2 - General
- Paragraph 3 - Normative publications and related documents
- Paragraph 4 - Labelling requirements
- Paragraph 6 - General administrative and technical requirements
- Paragraph 8 - Licence-exempt Radio Apparatus

Radio performance tests procedures given in RSS-247:

- Paragraph 3 - Certification requirements
- Paragraph 4 - Measurement method
- Paragraph 5 - Standard specifications for frequency hopping systems and digital transmission systems operating in the bands 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz

NAP: Not Applicable

NAs: Not Asked

Note 1: Integral antenna.

Note 2: See FCC part 15.247 (d).

Note 3: See FCC part 15.209. Unwanted emissions levels are all below the fundamental emission field strength level.

Note 4: Conducted measurement is not possible (integral antenna), so we used the radiated method in open field.

Note 5: The transceiver used LoRa protocol.

With Spread Factor 7:

The system hops to channel frequencies from a pseudo randomly ordered list of hopping frequencies. Each frequency is used equally on the average by the transmitter, and separated by a minimum of the 20 dB bandwidth of the hopping channel (144.306 kHz).

The frequency hopping system uses 64 channels.

The maximum timing by channel is 100.275 ms.

During 20 s, any channel is used 3 times (see appendix 5), then $3 \times 100.275 \text{ ms} = 300.825 \text{ ms}$, thus the average time of occupancy on any channel is less than 400 ms within a period of 20 seconds, in normal operating mode.

Number of channels	Observation period (s)	Maximal Duration of each burst (ms)	Number of burst repetition during observation period	average time of occupancy on any channel (ms)	Limits (ms)
64	20	100.275	3	300.825	400

With Spread Factor 10:

The system hops to channel frequencies from a pseudo randomly ordered list of hopping frequencies. Each frequency is used equally on the average by the transmitter, and separated by a minimum of the 20 dB bandwidth of the hopping channel (138.746 kHz).

The frequency hopping system uses 64 channels.

The maximum timing by channel is 98.235 ms

During 20 s, any channel is used 3 times (see appendix 5), then $3 \times 98.235 \text{ ms} = 294.705 \text{ ms}$, thus the average time of occupancy on any channel is less than 400 ms within a period of 10 / 20 / 30 / 0.4 seconds multiplied by the number of hopping channels employed, in normal operating mode.

Number of channels	Observation period (s)	Maximal Duration of each burst (ms)	Number of burst repetition during observation period	average time of occupancy on any channel (ms)	Limits (ms)
64	20	98.235	3	294.705	400

Note 6: Not applicable because the EUT use only the FHSS protocol.

Note 1: The transceiver used LoRa protocol.

With Spread Factor 7:

The channel bandwidth is the 20 dB emission bandwidth measured with the hopping stopped. We used the special function "occupied power bandwidth" from the spectrum analyzer which used the same methodology as described in the standard.

Channel 902.3 MHz = 147.145 kHz

Channel 908.7 MHz = 144.306 kHz

Channel 914.9 MHz = 147.185 kHz

The system hops to channel frequencies from a pseudo randomly ordered list of hopping frequencies. Each frequency is used equally on the average by the transmitter, and separated by a minimum of the 20 dB bandwidth of the hopping channel (144.306 kHz).

The frequency hopping system uses 64 channels.

Channel 902.3 MHz = 138.746 kHz

Channel 908.7 MHz = 141.506 kHz

Channel 914.9 MHz = 143.026 kHz

The system hops to channel frequencies from a pseudo randomly ordered list of hopping frequencies. Each frequency is used equally on the average by the transmitter, and separated by a minimum of the 20 dB bandwidth of the hopping channel (138.746 kHz).

The frequency hopping system uses 64 channels.

7. MEASUREMENT UNCERTAINTY

To declare, or not, the compliance with the specifications, it was not explicitly taken into account of uncertainty associated with the result(s)

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k=2$, which for normal distribution corresponds to a coverage probability of approximately 95%.

Method of paragraphs 7.8.6 and 6.10.6 of ANSI C63.10

Test set up:

Test realized in near field. All field strength measurements are correlated with the radiated maximum peak output power.

Test operating condition of the equipment:

The equipment under test is blocked in continuous modulated transmission mode, at the highest output power level at which the transmitter is intended to operate.

First the measure is realized with hopping function disabled and then repeated with the hopping function activated.

We used for power source the internal battery and we noted:

Voltage at the beginning of test (Vdc): 3.65

Voltage at the end of test (Vdc): 3.62

Percentage of voltage drop during the test (%): 0.82

Method of paragraph 7.8.5 of ANSI C63.10

Test set up:

First an exploratory radiated measurement was performed. During this phase the product is oriented in these two normal positions.

Then the final measurement is realized with the product on the most critical orientation.

The system is tested in an open area test site (OATS), the EUT is placed on a rotating table, 0.8m from a ground plane.

Zero degree azimuths correspond to the front of the device under test.

See test setup in appendix 2

Distance of antenna: 10 meters (in open area test site)**Antenna height:** 1 to 4 meters (in open area test site)**Antenna polarization:** vertical and horizontal (only the highest level is recorded)

The measurement of the radiated electro-magnetic field is realized with an analyser and peak detector. The resolution bandwidth is adjusted at 1 MHz and video bandwidth at 3 MHz.

Finally the radiated electro-magnetic field is converted in dBm with the following formula:

$EIRP(dBm) = E (dB\mu V/m) + 20\log(D) - 104.8$; where D is the measurement distance in meters and antenna with a Gain (unit in dBi) different following the frequencies used.

Equipment under test operating condition:

The equipment under test is blocked in continuous modulated transmission mode, at the highest output power level at which the transmitter is intended to operate.

We used for power source the internal battery and we noted:

APPENDIX 2: Radiated Test Setup

Anechoic chamber setup

Above 1 GHz

- 1: Equipment Under Test
- 2: Measurement antenna
- 3: Measurement equipment

Open area setup

Below 30 MHz

Between 30 MHz and 1 GHz
