1.1 PRODUCT INFORMATION

1.1.1 Technical Description

The Equipment Under Test (EUT) was a u-blox AG Model SARA-R410M™ LTE Cat-M1 Module as shown in the photographs below. The EUT is based on Qualcomm Technologies' MDM9206 LTE modem designed to allow a larger number of devices to connect to the Internet of Things (IoT). LTE Cat M1 is part of the new 3GPP Release 13 standard supporting low power wide area technologies in the licensed spectrum and specifically supports IoT applications with low to medium data throughput rates, as well as devices that require long battery lifetimes.

1.8.2 LTE Emission Designator (16QAM)

Emission Designator = 4M52W7D
 W = Frequency Modulation
 7= Quantized/Digital Info

1.8.3 Spurious Radiated Emission (below 1GHz)

Measuring equipment raw measurement (dBμV/m) @ 30 MHz			24.4
Correction Factor (dB)	Asset# 1066 (cable)	0.3	-12.6
	Asset# 1172 (cable)	0.3	
	Asset# 1016 (preamplifier)	-30.7	
	Asset# 1175(cable)	0.3	
	Asset# 1002 (antenna)	17.2	
Reported QuasiPeak Final Measurement (dBμV/m) @ 30MHz			11.8

1.8.4 Spurious Radiated Emission – Substitution Method

Example = 84dBμV/m @ 1413 MHz (numerical sample only)

The field strength reading of 84dBμV/m @ 1413 MHz (2nd Harmonic of 706.5 MHz) is the maximized measurement when the EUT is on the turntable measured at 3 meters. The gain of the substituted antenna is 7.8dBi while the transmit cable loss is 1.0 dB (cable between signal generator and the substituted antenna). The signal generator level is adjusted until the 84dBμV/m level at the receiving end is replicated (identical test setup, i.e. same antenna, cable/s and preamp). If the adjusted signal generator level is -18dBm, then we have the following for both EIRP and ERP as required:

$$\begin{aligned}
 P_{\text{EIRP}} &= -18 \text{ dBm} + 7.8 \text{ dBi} - 1 \text{ dB} \\
 &= 11.2 \text{ dBm} \\
 P_{\text{ERP}} &= P_{\text{EIRP}} - 2.15 \text{ dB} \\
 &= 11.2 \text{ dBm} - 2.15 \text{ dB} \\
 &= 9.05 \text{ dBm}
 \end{aligned}$$

2.5.2 Standard Applicable

Part 24 Subpart E §24.232(d)
Power measurements for transmissions by stations authorized under this section may be made either in accordance with a Commission-approved average power technique or in compliance with paragraph (e) of this section. In both instances, equipment employed must be authorized in accordance with the provisions of §24.51. In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB

RSS-133(5.4) and RSS-133(6.4)
In addition, the transmitter's peak-to-average power ratio (PAPR) shall not exceed 13 dB for more than 0.1% of the time using a signal corresponding to the highest PAPR during periods of continuous transmission.

2.5.6 Environmental Conditions

Test performed at TÜV SÜD America Inc. Rancho Bernardo facility.

Ambient Temperature	25.5 °C
Relative Humidity	49.9 %
ATM Pressure	98.7 kPa

2.5.7 Additional Observations

- This is a conducted test. Guidance is per Section 5.7 of KDB971168 (D01 Power Meas License Digital Systems v02r02).
- Procedure is per Section 5.7.1 of KDB971168.

- RBW was set to maximum the SA can support (28MHz, minimum requirement is $\geq$ signal's occupied bandwidth)
- Number of samples was adjusted until the CCDF curve was stabilized (≥ 4500000 samples).
- Measurement was done using the Spectrum Analyzer's Complementary Cumulative Distribution Function (CCDF) measurement profile. The built-in function is used to determine the largest deviation between the average and the peak power of the EUT in a given bandwidth (crest factor or peak-to-average ratio) The CCDF curve shows how much time the peak waveform spends at or above a given average power level. The percent of time the signals spends at or above the level defines the probability for that particular power level.
- The maximum PAPR level associated with a probability of 0.1% was recorded.
- There are no measured PAPR levels greater than 13dB. EUT complies.

2.7 FIELD STRENGTH OF SPURIOUS RADIATION

2.7.1 Specification Reference

Clause 7 of KDB971168 D01 v02r02

2.7.2 Standard Applicable

When antenna-port conducted measurements are performed to demonstrate compliance to the applicable unwanted emission limits, a separate radiated measurement is required to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Note that when radiated measurements are performed to demonstrate compliance to the unwanted emission limits (e.g., an EUT with integral transmit antenna), this measurement is not required.

These measurements may be performed with the transmit antenna port(s) terminated. Unless otherwise specified in the applicable rule section, the same limits applicable to spurious (unwanted) emissions at the antenna terminals also apply to radiated spurious emissions.

Test performed at TÜV SÜD America Inc. Rancho Bernardo facility.

Ambient Temperature	26.3 °C
Relative Humidity	47.5 %
ATM Pressure	98.7 kPa

2.8.7 Additional Observations

- This is a conducted test. The EUT was operated at 4.2VDC nominal voltage and was placed in the temperature chamber for the series of evaluations performed.
- Test methodology is per Section 5.6 of ANSI C63.26-2015, American National Standard for Compliance Testing of Transmitters Used in Licensed Radio Services.
- Voltage variations from Nominal Voltage of 4.2VDC were performed @ 20°C.
- Reference measurements were performed on mid channels only.
- The Temperature was set to 50°C and allowed to sit for 1 hour to allow the equipment and chamber temperature to stabilize. Once stabilized, the EUT was turned on and the measurement performed. The temperature was then decreased by 10°C steps and allowed to settle before taking the next set of measurements.
- For PCS devices, the maximum frequency deviation was used as frequency offset to verify that the fundamental emission stay within the authorized bands of operation.
- For Cellular devices, the maximum frequency deviation in percent was used to calculate maximum frequency deviation in parts per million (ppm).

Reference F_H @ 20°C: 1909.8442 MHz (based from High Channel upper edge 99% OBW)

Using Frequency Deviation as the offset for both F_L and F_H, we get the following:

$$F_L = 1850.1282 \text{ MHz} - 0.00045 \text{ MHz}$$
$$= 1850.12775 \text{ MHz (within the 1850 MHz to 1910 MHz Band, complies)}$$

$$F_H = 1909.8442 \text{ MHz} + 0.00045 \text{ MHz}$$
$$= 1909.84465 \text{ MHz (within the 1850 MHz to 1910 MHz Band, complies)}$$

2.9 RECEIVER SPURIOUS EMISSIONS

2.9.1 Specification Reference

RSS-132(4.6) and RSS-133(6.6)

2.9.2 Standard Applicable

Receiver spurious emissions shall comply with the limits specified in RSS-Gen.

2.9.3 Equipment Under Test and Modification State

Not performed. EUT does not fall to any category defined as Receiver under Section 5 of RSS-Gen Issue 4

2.10 POWER LINE CONDUCTED EMISSIONS

2.10.1 Specification Reference

RSS-Gen 8.8

2.10.2 Standard Applicable

A radio apparatus that is designed to be connected to the public utility (AC) power line shall ensure that the radio frequency voltage, which is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz-30 MHz, shall not exceed the limits in table below.

Unless the requirements applicable to a given device state otherwise, for any radio apparatus equipped to operate from the public utility AC power supply either directly or indirectly (such as with a battery charger), the radio frequency voltage of emissions conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in table below. The more stringent limit applies at the frequency range boundaries.

Frequency of emission (MHz)	Conducted limit (dBµV)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

**Decreases with the logarithm of the frequency.*

2.10.4 Date of Test/Initial of test personnel who performed the test

May 24, 2017/FSC

2.10.5 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.10.6 Environmental Conditions

Test performed at TÜV SÜD America Inc. Rancho Bernardo facility.

Ambient Temperature	26.5 °C
Relative Humidity	45.0 %
ATM Pressure	98.5 kPa

2.10.7 Additional Observations

- The EUT is a module. Test was performed to show general compliance to RSS-Gen Power Line Conducted Emissions requirements. As a general rule, the EUT should be verified in the final host. It is the responsibility of the module integrator to verify compliance of the final host.
- EUT was verified using the test configuration provided by the manufacturer (EUT on a development board powered by a support programmable power supply).
- The EUT was transmitting worst case configuration with a representative antenna.
- Measurement was done using EMC32 automated software. Reported level is the actual level with all the correction factors factored in. Correction Factor column is for informational purposes only. See Section 2.10.8 for sample computation.
