

## RF Exposure evaluation

According to 447498 D01 General RF Exposure  
Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for  
100 MHz to 6 GHz at test separation distances  $\leq$   
50 mm are determined by:

[ (max. power of channel, including tune-up  
tolerance, mW) / (min. test separation distance,  
mm) ]  $\cdot$  [  $\sqrt{f(\text{GHz})}$  ]  $\leq$  3.0 for 1-g SAR and  $\leq$  7.5 for  
10-g extremity SAR, where

- $f(\text{GHz})$  is the RF channel transmit frequency in  
GHz
- Power and distance are rounded to the nearest  
mW and mm before calculation
- The result is rounded to one decimal place for  
comparison

Worse case is as below: [ 2410.875 MHz 3.96dBm  
( 2.49 mW) output power]

( 2.49 mW /5mm)  $\cdot$  [  $\sqrt{2.410875 (\text{GHz})}$  ] = 0.8 < 3.0 for  
1-g SAR

Then SAR evaluation is not required
