2 Operational States

The operation mode of the equipment under test during the emission tests was defined as follows:

GSM850 GPRS data connection

- Downlink channel 189 (881.4 MHz),
- Uplink channel 661 (836.4 MHz),
- BS-Power -70 dBm; Mobile-Power 30 dBm; Packet switched, GPRS.

PCS1900 GPRS data connection

- Downlink channel 661 (1960.0 MHz),
- Uplink channel 661 (1880.0 MHz),
- BS-Power -70 dBm; Mobile-Power 30 dBm; Packet switched, GPRS.

UMTS band 2

- Downlink channel UARFCN 900 (1960.0 MHz),
- Uplink channel UARFCN 18900 (1880.0 MHz),
- BS-Power -70 dBm; Mobile-Power 24 dBm; Mode PRBS9.

UMTS band 4

- Downlink channel UARFCN 1637 (2132.4 MHz),
- Uplink channel UARFCN 1412 (1732.4 MHz),
- BS-Power -85 dBm; Mobile-Power 24 dBm; Mode PRBS9.

UMTS band 5

- Downlink channel UARFCN 4407 (881.4 MHz),
- Uplink channel UARFCN 4182 (836.4 MHz),
- BS-Power -85 dBm; Mobile-Power 24 dBm; Mode PRBS9.

LTE band 2

- Downlink channel UARFCN 900 (1960.0 MHz),
- Uplink channel UARFCN 18900 (1880.0 MHz),
- BS-Power -55 dBm; Mobile-Power 23 dBm; Mode PRBS9.

LTE band 4

- Downlink channel UARFCN 1637 (2132.4 MHz),
- Uplink channel UARFCN 1412 (1732.4 MHz),
- BS-Power -55 dBm; Mobile-Power 23 dBm; Mode PRBS9.

LTE band 5

- Downlink channel UARFCN 2524 (881.6 MHz),
- Uplink channel UARFCN 20524 (836.6 MHz),
- BS-Power -55 dBm; Mobile-Power 23 dBm; Mode PRBS9.

LTE band 7

- Downlink channel UARFCN 3100 (2655.0 MHz),
- Uplink channel UARFCN 21100 (2535.0 MHz),
- BS-Power -55 dBm; Mobile-Power 23 dBm; Mode PRBS9.

LTE band 17

- Downlink channel UARFCN 5790 (740.0 MHz),
- Uplink channel UARFCN 23790 (710.0 MHz),
- BS-Power -55 dBm; Mobile-Power 23 dBm; Mode PRBS9.

The EUT has two RF ports for cellular communication with a characteristic impedance of 50 Ω . The primary antenna port (ANT1) supports both Tx and Rx, providing the main antenna interface, while the secondary antenna port (ANT2) supports Rx only for the LTE MIMO 2x2 and 3G Rx diversity configurations.

The system was set up as follows:

A GSM /LTE connection to the EUT was established by using a Wideband Communication Tester (CMW500). The EUT was connected wireless to the tester via a narrowband antenna.

Additionally, the WIFI module of the EUT was set to transmit in b-mode 11 Mbps on channel 1 with maximum output power to reflect a simultaneous transmission scenario. This has been done by means of a software called "Putty"(Release 0.65) and Labtool (Version 2.0.0.75), provided by the applicant.

The GPS reception was also active during the measurement.

3 Additional Information

The applicant has applied modifications to the trace design of the cellular RF module and therefore requested retesting of the radiated spurious emissions. The test report includes only worst-case test results for radiated emissions as ordered by the applicant.

5 Overview

6 Results of radiated spurious emissions

6.1 Method of measurement

The EUT is measured in the frequency range from 30 MHz to 26.5 GHz in a semi anechoic chamber with a metal ground plane, which has been validated to the requirements of ANSI C63.4. It is placed on a 3D-positioner to allow different positions at a distance of 3 meters from the receiving antenna. Both polarizations (vertical and horizontal) have been evaluated and the turn table has been turned to 360° to maximize the emissions. The receiving antenna is raised from 1 to 4m.

The frequency range from 30 MHz to 18 GHz has been tested using the substitution method as described in [1], and the frequency range from 18 to 26.5 GHz has been tested using the field strength method [1]. The measured field strength using the field strength method is then converted to an ERP or EIRP [dBm] using the formula:

$E \text{ [dB}\mu\text{V/m]} = \text{EIRP [dBm]} - 20\log(d) + 104.8$ according to chapter 5.2.7 [1].

→ $\text{EIRP} = E - 95.25$ ($d = 3 \text{ m}$ measuring distance)

$\text{ERP [dBm]} = \text{EIRP} - 2.15 \text{ dB}$

Level (dBm) $\triangleq$ ERP (below 1GHz) or EIRP (above 1 GHz)

Procedure preliminary measurement:

The following procedure is used:

1. Set the measurement antenna to 1 m height.
2. Monitor the frequency range at vertical polarisation and a EUT azimuth of 0 °.
3. Rotate the EUT by 360° to maximize the detected signals.
4. Repeat 1) to 2) with the horizontal polarisation of the measuring antenna.
5. Increase the height of the antenna for 0.5 m and repeat steps 2 – 4 until the final height of 4 m is reached.
6. The highest values for each frequency will be saved by the software, including the antenna height, measurement antenna polarization and turntable azimuth for that value.

Procedure final measurement:

The following procedure is used:

1. Select the highest frequency peaks to the limit for the final measurement.
2. The software will determine the exact peak frequencies by doing a partial scan with reduced RBW with +/- 10 times the RBW of the pre-scan of the selected peaks.
3. If the EUT is portable or ceiling mounted, find the worst case EUT position (x,y,z) for the final test.
4. The worst measurement antenna height is found by the measurement software by varying the measurement antenna height by +/- 0.5 m from the value obtained in the preliminary measurement, and to monitor the emission level.
5. The worst azimuth turntable position is found by varying the turntable azimuth by +/- 25° from the value obtained in the preliminary measurement, and to monitor the emission level.
6. The final measurement is performed at the worst-case antenna height and the worst-case turntable azimuth
7. Steps 2 – 6 will be repeated for each frequency peak selected in step 1.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 1 GHz	100 kHz
1 GHz to 4 GHz	1 MHz
4 GHz to 12 GHz	1 MHz
12 GHz to 18 GHz	1 MHz
18 GHz to 25 / 26.5 GHz	1 MHz
26.5 GHz to 40 GHz	1 MHz

6.2 Radiated spurious emissions results:

Limit: The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log (P)$ dB [3][4][5].

This results into a limit of -13 dBm for all power levels of the UE.

2412.0	WLAN Signal, no spurious	
Measurement uncertainty: +2.2 dB / -3.6 dB		

Limit: The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log (P)$ dB [3][4][5].

This results into a limit of -13 dBm for all power levels of the UE.

All emissions show more than 20 dB margin to the limit. Therefore, no final measurement has been performed.

Test equipment (please refer to chapter 6 for details)
1 - 29

Results 30 MHz to 200 MHz

Results 200 MHz to 1 GHz

Results 1 to 4 GHz

Results 4 to 18 GHz
