Power density (S) is calculated according to the formula:

$$S = PG / (4\pi R^2)$$

Where S = power density in mW/cm<sup>2</sup>

P = transmit power in mW

G = numeric gain of transmit antenna (numeric gain=Log-1(dB antenna gain/10))

R = distance (cm)

As we can see from the test report 161101314SHA-001:

| Frequency band | Power | Antenna Gain | R    | S                     | Limits                |
|----------------|-------|--------------|------|-----------------------|-----------------------|
| (MHz)          | dBm   | dBi          | (cm) | (mW/cm <sup>2</sup> ) | (mW/cm <sup>2</sup> ) |
| 2400 -2483.5   | 7.291 | 0.5          | 20   | 0.0012                | 1                     |

## **Appendix I**

### **Definition below must be outlined in the User Manual:**

To satisfy FCC RF exposure requirements, a separation distance of 20 cm or more should be maintained between the antenna of this device and persons during device operation.  
To ensure compliance, operations at closer than this distance is not recommended.
