## 5.4. Configuration of EUT on Measurement

The following equipment is installed on Radiated Emission Measurement to meet the commission requirements and operating regulations in a manner which tends to maximize its emission characteristics in normal application.

### 5.4.1. SPEAKER (EUT)

Model Number : TQ-LT1203  
Serial Number : N/A  
Manufacturer : TQL TRADING INC.

## 5.5.Operating Condition of EUT

5.5.1.Setup the EUT and simulator as shown as Section 5.1.

5.5.2.Turn on the power of all equipment.

5.5.3.Let the EUT work in TX mode measure it.

## 5.6.Test Procedure

The EUT and its simulators are placed on a turntable, which is 0.8 meter high above ground(Below 1GHz). The EUT and its simulators are placed on a turntable, which is 1.5 meter high above ground(Above 1GHz). The turntable can rotate 360 degrees to determine the position of the maximum emission level. EUT is set 3.0 meters away from the receiving antenna, which is mounted on an antenna tower. The antenna can be moved up and down between 1.0 meter and 4 meters to find out the maximum emission level. Broadband antenna (calibrated bi-log antenna) is used as receiving antenna. Both horizontal and vertical polarizations of the antenna are set on measurement. In order to find the maximum emission levels, all of the EUT location must be manipulated according to ANSI C63.10:2013 on radiated emission measurement. The EUT was tested in 3 orthogonal planes.

The bandwidth of test receiver is set at 120 kHz in 30-1000 MHz, and 1 MHz in 1000-2000 MHz.

The frequency range from 9KHz to 2GHz is checked.

## 5.7.The Field Strength of Radiation Emission Measurement Results

**PASS.**

Calculation: Limit(dBm)=EL-43-10log(TP)

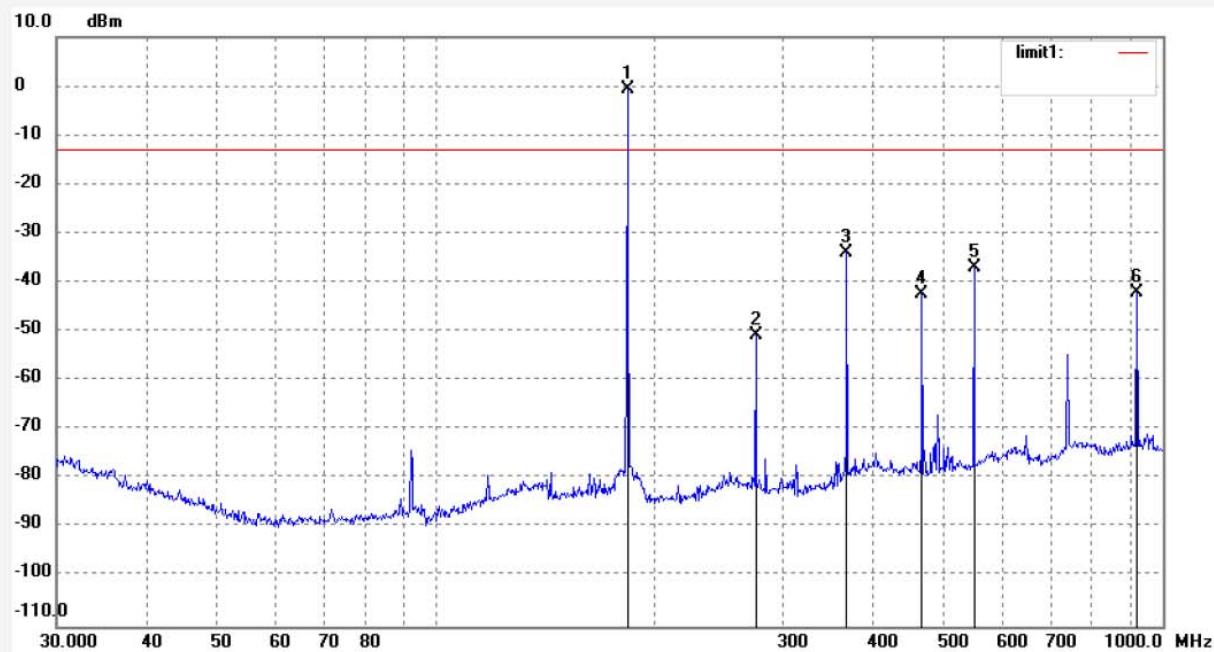

Note: TP=  $\lfloor 10 \times (EL/10) \rfloor /1000W$ .

Limit(dBm)=EL-43-10log(TP)=-13dBm

## 8. MODULATION CHARACTERISTICS

### 8.1. Block Diagram of Test Setup

#### 8.1.1. Block diagram of connection between the EUT and simulators

### 8.2. Test description

8.2.1. Per FCC rule part 2.1047(a) the modulation characteristics of the radio were measured across its rated audio input voltage and frequency ranges. For Voice Modulation Communication Equipment, the frequency response of the audio modulation circuit over a range of 100 to 5000Hz shall be measured.

8.2.2. According to CFR 47 section 74.861(e)-3, any form of modulation may be used. A maximum deviation of  $\pm 75\text{KHz}$  is permitted when frequency modulation is employed.

### 8.3. Measurement method

#### 8.3.1. Modulation limit

1. Configure the EUT as shown in figure 8.1.1, adjust the audio input for 60% of rated system deviation at 1KHz using this level as a reference(0dB) and vary the input level from -20 to +20dB. Record the frequency deviation obtained as a function of the input level.

2. Repeat step 1 with input frequency changing to 300, 1000, 3000, and 12000Hz in sequence.

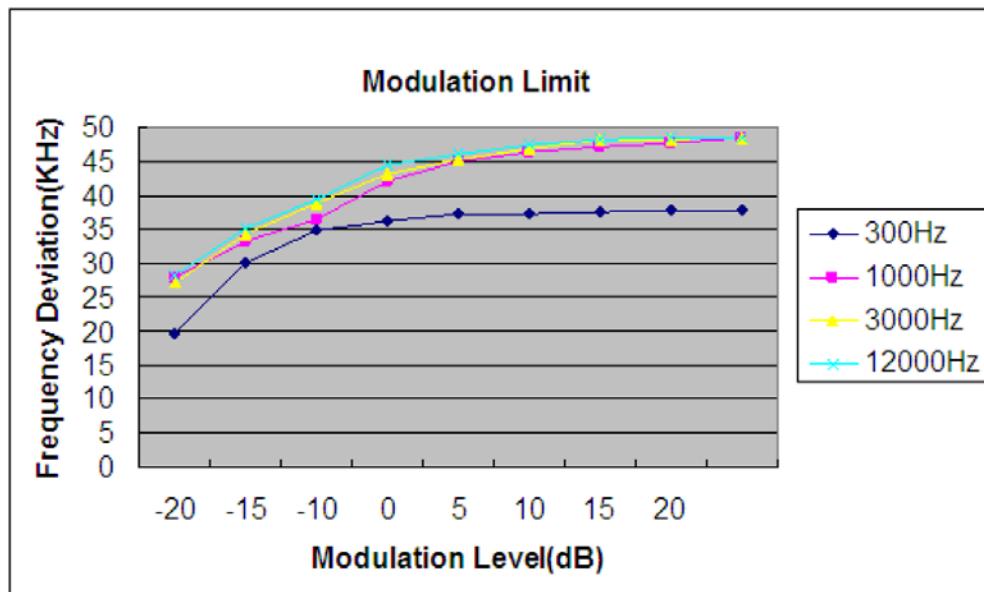

## 8.3.2. Audio frequency response

1. Configure the EUT as shown in figure
2. Adjust the audio input for 20% of rated system deviation at 1KHz using this level as a reference(0dB).
3. Vary the Audio frequency from 100Hz to 30KHz and record the frequency deviation.
4.  $\text{Audio Frequency Response} = 20\log_{10}(\text{Deviation of test frequency}/\text{Deviation of 1KHz reference})$ .

## 9. ANTENNA REQUIREMENT

### 9.1. The Requirement

According to Section 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

### 9.2. Antenna Construction

Device is equipped with Integral antenna, which isn't displaced by other antenna. The Antenna gain of EUT is 1dBi. Therefore, the equipment complies with the antenna requirement of Section 15.203.
