ETC Report #: t29e24a242_DTS Release 2

Report date: December 3, 2024

EMC testing of the Tektelic Communication Inc. *Kona Enterprise Gateway & Kona Photon Gateway in accordance with FCC Part 15.247 and ANSI C63.10: 2013 as referenced by FCC OET KDB 558074 D01 15.247 Meas Guidance v05r02.

FCC ID: 2ALEPT0009193

Test Dates: July 22 - 30, 2024, Aug. 2 - 5, 2024, Oct 25, 2024

Test Personnel: Janet Mijares, Brendan Van Hee, Imran Akram

Prepared for: Tektelic Communication Inc.

* Both Gateways contain LTE pre-certified modules.

REVISION RECORD

ISSUE	DATE	AUTHOR	REVISIONS
DRAFT 1	2024-08-16	I. Akram/JM	Initial draft submitted for review.
DRAFT 2	2024-09-24	I. Akram	Added FCC ID
DRAFT 3	2024-11-19	I. Akram	Added radiated spurious emission above 1.4GHz test result for internal antennas in section 2.8.6 and internal antenna information for enterprise gateway in section 1.3.
Release 1	2024-11-22	I. Akram	Sign Off
Release 2	2024-12-03	I. Akram	Cable calibration dates added in sections 2.1.3, 2.2.3, 2.3.3, 2.4.3, 2.5.3 and 2.6.3.

1.0 INTRODUCTION

1.1 Scope

The purpose of this report is to present the results of compliance testing performed in accordance with FCC Part 15.247 and ANSI C63.10:2013/2020 to gain FCC new Authorization for Low-Power License-Exempt transmitters. All test procedures, limits, criteria, and results described in this report apply only to the Tektelic Communication Inc. Kona Enterprise Gateway & Kona Photon Gateway test sample, referred to herein as the EUT (Equipment Under Test).

This report does not imply product endorsement by the Electronics Test Centre, A2LA, nor any Canadian Government agency.

1.2 Applicant

This test report has been prepared for Tektelic Communication Inc., located in Calgary, Alberta, Canada.

1.3 Test Sample Description

As provided to ETC (Airdrie) by Tektelic Communication Inc.:

Product Name:		Kona Enterprise Gateway & Kona Photon Gateway
Radio		LoRa
Frequency Band		902 – 928 MHz
Frequency Range		903 – 927.5 MHz
TX Operating Mode		500KHz DTS
Max Transmit Power (Conducted)		0.473 W (26.75 dBm)
LoRa	Associated External Antennas	WTTX-OMNI08600930-8-NJ, Polarization Vertical, Gain= 8dBi (highest gain antenna) , WTTX-OMNI08600930-6-NJ, Gain = 6dBi , WTTX-OMNI08600930-2.5-NJ, Gain = 2.5dBi
	Associated Internal Antennas(Only for Enterprise variant)	Montana SRF2I019, Polarization Linear, Gain=1.9dBi Peak
	Detachable/Non Detachable	External Antenna are detachable (Professional Installation)
Model#		T0007430, T0008479
Serial#		2308J0012, 2431K0002
Power supply:		Kona Enterprise Gateway powered via POE and Kona Photon Gateway Variant powered via Solar Panel

Note: There are two main variant of the EUT named as

- 1 **Kona Enterprise Gateway (POE)** T0007430 (With LTE module), T0007432 (without LTE capability)
- 2 **Kona Photon Gateway (Solar power)**. T0008479

The Kona Enterprise Gateway (POE) has two variant with LTE option and without LTE option. There is no difference in radio circuitry between the variants except Kona Enterprise Gateway powered by POE and Kona Photon Gateway variant powered by solar panel. The Kona photon Gateway enclosure is bigger than Enterprise to accommodate the internal batteries. The Kona Enterprise with LTE option and Photon Gateway both tested for radiated spurious emission. Both units are installed in one fix position at final installation. All three channels (LOW, MID, High) are analyzed to determine the worse channel at their final installation position. Full emission scan is performed on worse channel with highest external gain antenna. Enterprise gateway can be used with internal antennas. Enterprise gateway was tested with internal antennas as well for radiated spurious emission. During radiated Spurious emission analysis both LTE (Pre-certified) radio and LoRa radio are transmitting simultaneously to cover the co-location requirements.

1.4 General Test Conditions

The EUT was set up and exercised using the configurations, modes of operation and arrangements defined in this report only. All inputs and outputs to and from other equipment associated with the EUT were adequately simulated. In order to meet the operational requirements during testing as per KDB 558074 D01 15.247 Meas Guidance v05r02 and ANSI C63.10-2013 clause 5.11 the device was programmed with a special firmware to transmit at a continuous transmit mode (100% duty cycle). Special firmware is strictly for testing purpose only and not available to end user. This special test case represents the worst-case duty cycle. Both Kona Gateways contain pre-certified LTE modules. All radiated spurious emission and antenna port conducted emission tests performed when both radios are transmitting simultaneously LTE port terminated in 50Ω termination during antenna port measurements. The environmental conditions are recorded during each test, and are reported in the relevant sections of this document.

1.5 Reference Standards

Standards	Description
FCC, title 47 CFR § 15.247	Operation within the bands 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz.
FCC, title 47 CFR § 15.207	Conducted limits for an intentional radiator that is designed to be connected to the public utility (AC) power line.
FCC, title 47 CFR § 15.107	Conducted limits for equipment that is designed to be connected to the public utility (AC) power line.
FCC, title 47 CFR § 15.209	Radiated emission limits; general requirements
FCC, title 47 CFR § 15.109	Radiated emission limits; from unintentional radiators digital devices.
ANSI C63.10-2013	American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices
ANSI C63.4-2014	American National Standard for Methods of Measurement of Radio – Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the range of 9 KHz to 40 GHz
558074 D01 15.247 Meas Guidance v05r02	Guidance For Compliance Measurements On Digital Transmission System, Frequency Hopping Spread Spectrum System, And Hybrid System Devices Operating Under Section 15.247 Of The FCC Rules

1.6 Test Methodology

Test methods are specified in the Basic Standard as referenced and/or modified by the Product Standard in the part of Section 2 of this report associated with each particular test case. EUT is tested in RX mode to cover FCC Part 15 Sub Part B (Digital Circuitry), and the result is included in this test report.

1.6.1 Variations in Test Methodology

Any variance in methodology or deviation from the reference Standard is documented in the part of Section 2 of this report associated with each particular Test Case.

1.6.2 Test Sample Verification, Configuration & Modifications

EUT setup, configuration, protocols for operation and monitoring of EUT functions, and any modifications performed in order to meet the requirements, are detailed in each Test Case of Section 2 of this report.

1.6.3 Uncertainty of Measurement:

The factors contributing to measurement uncertainty are identified and calculated in accordance with CISPR 16-4-2: 2011.

This uncertainty estimate represents an expended uncertainty expressed at approximately 95% confidence using a coverage factor of $k = 2$.

Test Method	Uncertainty
Radiated Emissions Level (9 KHz – 30 MHz)	±4.72 dB
Radiated Emissions Level (9 KHz – 1 GHz)	±5.55 dB
Radiated Emissions Level (1 GHz – 18 GHz)	±4.90 dB
Conducted Emissions Level (150 KHz – 30 MHz)	±2.36 dB
Uncertainty Conducted Power level	±0.5 dB
Uncertainty Conducted Spurious emission level	±0.6 dB
Uncertainty for Bandwidth test	±1.5 %

2.0 TEST CONCLUSION

STATEMENT OF COMPLIANCE

The customer equipment referred to in this report was found to comply with the requirements, as summarized below.

The EUT was subjected to the following tests. Compliance status is reported as **Compliant** or **Non-compliant**. **N/A** indicates the test was Not Applicable to the EUT.

The measurement uncertainty is not accounted for determination of the statement of compliance. The statement of compliance is based only on the measurement value recorded.

Note: Maintenance of compliance is the responsibility of the Manufacturer. Any modifications to the product should be assessed to determine their potential impact on the compliance status of the EUT with respect to the standards detailed in this test report.

The following table summarizes the tests performed in terms of the specification, class or performance criterion applied, and the EUT modification state.

Test Case	Test Type	Specification	Test Sample	Result
2.1	AC Main Conducted Emissions	15.207 / 15.107	Kona Enterprise Gateway	Compliant
2.2	6dB Bandwidth	15.247(a)	Kona Enterprise Gateway Kona Photon Gateway	Compliant
2.3	Max Output Power	15.247(d)	Kona Enterprise Gateway Kona Photon Gateway	Compliant
2.4	Band Edge	15.247(d)	Kona Enterprise Gateway Kona Photon Gateway	Compliant
2.5	Power Spectral Density	15.247(e)	Kona Enterprise Gateway Kona Photon Gateway	Compliant
2.6	Conducted Spurious Emissions (Non-Restricted Band)	15.247(d)	Kona Enterprise Gateway Kona Photon Gateway	Compliant
2.7	EUT Position	ANSI C63.4	Kona Enterprise Gateway Kona Photon Gateway	N/A
2.8	Radiated Spurious Emission (Restricted Band)	15.205, 15.209 15.247(d)	Kona Enterprise Gateway Kona Photon Gateway	Compliant
2.9	Radiated Emission	15.109	Kona Enterprise Gateway Kona Photon Gateway	Compliant
2.10	RF Exposure	15.247(i)	Kona Enterprise Gateway Kona Photon Gateway	Exempt

Refer to the test data for applicable test conditions.

2.1 AC Main Power Line Conducted Emissions:

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway
Test Personnel: Janet Mijares	Standard: FCC Part 15.207, FCC Part 15.107
Date: 2024-07-26 (21.0°C, 34.1% RH)	Basic Standard: ANSI C63.10: 2013 Basic Standard: ANSI C63.4: 2014
EUT status: Compliant	
Note: Test not applicable to Kona photon gateway. Photon variant is solar powered.	

Specification: FCC Part 15.207

Frequency (MHz)	Quasi-Peak Limit (dBμV)	Average Limit (dBμV)
0.15 – 0.5	66 to 56 *	56 to 46 *
0.5 – 5	56	46
5 – 30	60	50
Criteria: The conducted emissions produced by a device shall not exceed the limits as specified.		
Limits decrease linearly with the logarithm of the frequency		

Specification: FCC Part 15.107

Frequency (MHz)	Quasi-Peak Limit (dBμV)	Average Limit (dBμV)
0.15 – 0.5	79	66
0.5 – 5	73	60
5 – 30	73	60
Criteria: The conducted emissions produced by a device shall not exceed the limits as specified.		
Note: The more stringent limit applies at transition frequencies.		

2.1.1 Test Guidance

Before any testing is performed, the Ambient (measurement noise floor) is recorded, and a QC check is performed to show that the system is functioning correctly.

The EUT is powered through a 50μH Line Impedance Stabilizing Network (LISN) which is placed 80cm away from the EUT. For tabletop equipment, a vertical ground plane is placed 40cm from the edge of the table. Lastly, the spectrum analyzer is connected to the LISN via armored cable run from the control room to the test chamber. Both the LISN and vertical ground plane are grounded to the reference ground plane on the chamber floor.

Testing starts with a scan, performed under software control. After this is complete, the list of frequencies of interest is generated. These frequencies are then investigated for quasi-peak and average amplitude, as applicable. Emissions measured with a QP detector that fall below the Average limit are deemed to meet both requirements.

2.1.2 Deviations From The Standard

There were no deviations from the EUT setup or methodology specified in the standard.

2.1.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Calibration Date	Calibration Due
EMC Software	UL	Ver. 9.5	SWE021	N/A	
EMI receiver	Agilent	N9038A FW A.25.05	6130	2023-08-11	2024-08-11
LISN 150kHz to 30MHz	Com-Power	LI-215A	6180	2022-08-09	2024-08-09
T/H Data Logger	Extech Ins.	42270	5892	2024-04-08	2025-04-08
CE Cable	Insulated Wire Incorporated	KPS-1501A-3600- KPS 01102006	4436	2024-01-09	2025-01-09

2.1.4 Test Sample Verification, Configuration & Modifications

The EUT was set to transmit continuously on a selected channel with test-specific software. The output was modulated as in normal operation. EUT has option of POE. EUT tested for conducted emission on AC side of POE adaptor model#PD-9501GO-ET/AC and serial#C19026674000302. Customer is not providing POE adaptor with EUT.

The EUT met the requirements without modification.

Diagram of setup for Conducted Emissions testing:

2.1.5 Conducted Emissions Data TX Mode

The emissions data is presented in tabular form, showing the uncorrected spectrum analyzer reading, the correction factors applied, the net result, the value(s) of limit at the frequency measured, and the Delta between the result and the limit.

Freq. Marker	Freq. (MHz)	Raw reading (dBµV)	Det.	LISN Factor (dB/m)	Cable Loss (dB)	Corrected Reading (dBµV)	FCC 207 Limit (dBµV)	Delta (dB)	L / N
1	0.497	26.72	AV	0	9.7	36.42	46.05	-9.63	Line
2	0.519	27.26	AV	0	9.7	36.96	46	-9.04	Line
3	3.34	26.15	AV	0	9.8	35.96	46	-10.05	Line
4	3.86	24.96	AV	0	9.9	34.86	46	-11.14	Line
5	7.375	23.37	AV	0	10	33.37	50	-16.63	Line
6	15.91	23.11	AV	0.1	10.5	33.71	50	-16.29	Line
7	0.155	21.89	AV	0.1	9.7	31.69	55.73	-24.04	Line
1	0.155	24.22	AV	0.1	9.7	34.02	55.73	-21.71	Neutral
2	0.520	28.77	AV	0	9.7	38.47	46	-7.53	Neutral
3	3.34	26.14	AV	0	9.8	35.94	46	-10.06	Neutral
4	3.79	25.65	AV	0	9.9	35.55	46	-10.45	Neutral
5	7.35	22.63	AV	0	10	32.63	50	-17.37	Neutral
6	16.18	21.85	AV	0	10.5	32.35	50	-17.65	Neutral

Meter Reading in dBµV + LISN Factor in dB + Gain/Loss Factor in dB = Corrected Emission Strength in dBµV.

Notes:

- When a preamp is used, the resulting gain is compensated, producing a negative value for the Cable Loss.
- Av = Linear Average detector

Negative values for Delta indicate compliance.

Plot of Conducted Emissions: LINE

Plot of Conducted Emissions: Neutral

2.1.6 Conducted Emissions Data RX Mode

The emissions data is presented in tabular form, showing the uncorrected spectrum analyzer reading, the correction factors applied, the net result, the value(s) of limit at the frequency measured, and the Delta between the result and the limit.

Freq. Marker	Freq. (MHz)	Raw reading (dBµV)	Det.	LISN Factor (dB/m)	Cable Loss (dB)	Corrected Reading (dBµV)	Class A AV Limit (dBµV)	Delta (dB)	L / N
1	0.154	20.98	AV	.1	9.7	30.78	66	-35.22	Line
2	0.181	14.28	AV	.1	9.7	24.08	66	-41.92	Line
3	0.5	23.73	AV	0	9.7	33.43	60	-26.57	Line
4	0.520	23.15	AV	0	9.7	32.85	60	-27.15	Line
5	3.36	26.43	AV	0	9.8	36.23	60	-23.77	Line
6	3.74	24.28	AV	0	9.9	34.18	60	-25.82	Line
1	0.156	20.0	AV	0.1	9.7	29.8	66	-36.2	Neutral
2	0.181	16.81	AV	0.1	9.7	26.61	66	-39.39	Neutral
3	0.499	22.58	AV	0	9.7	32.28	60	-27.72	Neutral
4	0.521	23.01	AV	0	9.7	32.71	60	-27.29	Neutral
5	3.34	26.16	AV	0	9.8	35.96	60	-24.02	Neutral
6	3.84	25.37	AV	0	9.9	35.27	60	-24.73	Neutral

Meter Reading in dBµV + LISN Factor in dB + Gain/Loss Factor in dB = Corrected Emission Strength in dBµV.

Notes:

- When a preamp is used, the resulting gain is compensated, producing a negative value for the Cable Loss.
- Av = Linear Average detector

Negative values for Delta indicate compliance.

Plot of Conducted Emissions: LINE

Plot of Conducted Emissions: Neutral

2.2 6dB Bandwidth

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway Kona Photon Gateway
Test Personnel: Janet Mijares	
Date: 2024-07-22 (25.5°C, 41.8% RH)	Standard: FCC PART 15.247 Basic Standard: ANSI C63.10-2013 FCC OET KDB 558074
EUT status: Compliant	

Specification: FCC Part 15.247 (a, 2), FCC 15.215 (c)

Criteria: Systems using digital modulation techniques may operate in the 902-928 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

2.2.1 Test Guidance: ANSI C63.10-2013, Clause 11.8 / FCC OET KDB 558074

This measurement is performed at low, mid and high frequencies, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

For DTS the spectrum analyzer is set for a frequency span $\geq (2 * OBW)$, $\leq (5 * OBW)$, selected to clearly display the channel. The RBW is set to 100 kHz. The VBW is set to $\geq (3 * RBW)$. The Peak detector is used, with the trace set to Max Hold.

The automated 99% BW function of the spectrum analyzer is engaged, and the 6 dB OBW and/or 20 dB OBW is measured with the x dB function.

2.2.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

2.2.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date	Cal. Due
EMI receiver	Agilent	N9038A (FW A.25.05)	6130	2023-08-11	2024-08-11
Temp/Humidity	Extech	42270	5871	2024-04-08	2025-04-08
Attenuator (DC to 26 GHz)	Mini-Circuits	BW-S10-2W263+	6932	2022-12-10	2025-12-10
Coaxial Cables (RF)	W.L. GORE	PGR01R01036	7024	2024-01-09	2025-01-09
DC Blocker (9 KHz - 27 GHz)	Centric RF	C0927 SMA	6987	2024-01-19	2025-01-19

2.2.4 Test Sample Verification, Configuration & Modifications

The EUT was set to transmit continuously on a selected channel with test-specific software.
The output was modulated as in normal operation.

The EUT met the requirements without modification.

Test setup diagrams for Occupied Bandwidth testing:

Conducted:

2.2.5 Channel Bandwidth Data: LoRa DTS

Mode of operation	Channel	Freq. [MHz]	6 dB BW [kHz]	Limit BW [KHz]
LoRa 500 KHz	Low	903.0	636.0	≥ 500
	Mid	914.2	633.2	
	High	927.5	629.1	

Screen Captures from the spectrum analyzer: Low Channel

Screen Captures from the spectrum analyzer: MID Channel

Screen Captures from the spectrum analyzer: High Channel

2.3 Max Average Output Power

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway Kona Photon Gateway
Test Personnel: Janet Mijares	Standard: FCC PART 15.247
Date: 2024-07-22 (25.5°C, 41.8% RH)	Basic Standard: ANSI C63.10: 2013 FCC OET KDB 558074
EUT status: Compliant	

Specification: FCC Part 15.247(b, 3)

Criteria (3) For systems using digital modulation in the 902-928 MHz bands: 1 Watt.

2.3.1 Test Guidance: ANSI C63.10-2013, Clause 11.9.2.2.2/ FCC OET KDB 558074

This measurement is performed at low, mid and high frequencies, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

Output Power Method AVGSA-1 For LoRa DTS	
Span	≥ 1.5 times the OBW
RBW	1 – 5 % of the OBW, ≤ 1 MHz
VBW	$\geq 3 \times$ RBW
Number of Points in sweep	$\geq 2 \times$ Span / RBW
Sweep time	Auto
Detector	RMS (Power Averaging)
Sweep trigger	Free Run (Duty Cycle $\geq 98\%$)
Trace Average	100 traces in power Averaging (RMS)
Power measured	Integrated the spectrum across the OBW of the signal using the S/A band power measurement function, with band limit set equal to the OBW band edge.

2.3.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

2.3.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date	Cal. Due
EMI receiver	Agilent	N9038A (FW A.25.05)	6130	2023-08-11	2024-08-11
Temp/Humidity	Extech	42270	5871	2024-04-08	2025-04-08
Attenuator (DC to 26 GHz)	Mini-Circuits	BW-S10-2W263+	6932	2022-12-10	2025-12-10
Coaxial Cables (RF)	W.L. GORE	PGR01R01036	7024	2024-01-09	2025-01-09
DC Blocker (9 KHz - 27 GHz)	Centric RF	C0927 SMA	6987	2024-01-19	2025-01-19

2.3.4 Test Sample Verification, Configuration & Modifications

The EUT was set to a selected channel with test-specific software. The output was modulated as in normal operation.

The EUT met the requirements without modification.

Test setup diagrams for Power testing:

Conducted:

2.3.5 Max Average Output Power Data: LoRa DTS

Mode of operation	Channel	Freq. [MHz]	Max Average Power [dBm]	Limit Power [dBm]
LoRa 500 KHz	Low	903.0	26.54	≤ 30 (1Watt)
	Mid	914.2	26.22	
	High	927.5	26.75

2.4 Band Edge Attenuation

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway Kona Photon Gateway
Test Personnel: Janet Mijares	Standard: FCC PART 15.247
Date: 2024-07-22 (25.5°C, 41.8% RH)	Basic Standard: ANSI C63.10: 2013 FCC OET KDB 558074
EUT status: Compliant	

Specification: FCC Part 15.247(d)

Criteria:

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dBc below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dBc instead of 20 dBc. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

2.4.1 Test Guidance: ANSI C63.10-2013 Clause 11.13.2 & 6.10.4, 6.10.6 / FCC OET KDB 558074

This measurement is performed at the low and high frequencies, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

The spectrum analyzer is set for a frequency span to show the band edge and the nearest channel. The RBW is set to ≥ 100 kHz. The VBW is set to $\geq (\text{RBW} * 3)$. The Peak detector is used, with the trace set to Max Hold.

The attenuation is measured with the Marker Delta function.

2.4.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

2.4.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date	Cal. Due
EMI receiver	Agilent	N9038A (FW A.25.05)	6130	2023-08-11	2024-08-11
Temp/Humidity	Extech	42270	5871	2024-04-08	2025-04-08
Attenuator (DC to 26 GHz)	Mini-Circuits	BW-S10-2W263+	6932	2022-12-10	2025-12-10
Coaxial Cables (RF)	W.L. GORE	PGR01R01036	7024	2024-01-09	2025-01-09
DC Blocker (9 KHz - 27 GHz)	Centric RF	C0927 SMA	6987	2024-01-19	2025-01-19

2.4.4 Test Sample Verification, Configuration & Modifications

The EUT was set to transmit continuously on a selected channel with test-specific software. The output was modulated as in normal operation.

The EUT met the requirements without modification.

Test setup diagrams for Band Edge Attenuation testing:

Conducted:

2.4.5 Band Edge Data LoRa DTS

Worse Case Data

Mode of operation	Channel	Attenuation at Band Edge	Attenuation Limit at Band Edge
Lora 500KHz	903.0	56.263dBc	≥30 dBc
	927.5	30.547dBc	

Screen Capture from the spectrum analyzer: Lower Band Edge

Screen Capture from the spectrum analyzer: Upper Band Edge

2.5 Power Spectral Density

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway Kona Photon Gateway
Test Personnel: Janet Mijares	Standard: FCC PART 15.247
Date: 2024-07-22 (25.5°C, 41.8% RH)	Basic Standard: ANSI C63.10: 2013
EUT status: Compliant	

Specification: FCC Part 15.247(e)

Criteria For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

2.5.1 Test Guidance: ANSI C63.10-2013, Clause 11.10.3 / FCC OET KDB 558074

This measurement is performed at low, mid and high frequencies, in continuous transmission, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

Method AVGPSD-1 For DTS	
Span	≥ 1.5 times the OBW
RBW	$3 \text{ kHz} \leq \text{RBW} \leq 100 \text{ kHz}$.
VBW	$\geq 3 \times \text{RBW}$
Number of Points in sweep	$\geq 2 \times \text{Span} / \text{RBW}$
Sweep time	auto couple
Detector	RMS (Power Averaging)
Sweep trigger	Free Run (Duty Cycle $\geq 98\%$)
Trace Average	Minimum 100 traces in power Averaging (RMS)
PSD measured	Use the peak marker function to determine the maximum amplitude level.
If the measured value exceeds requirement, then reduce RBW (but no less than 3 kHz) and repeat (note that this may require zooming in on the emission of interest and reducing the span to meet the minimum measurement point requirement as the RBW is reduced).	

2.5.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

2.5.3 Test Equipment

Testing was performed with this equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date	Cal. Due

2.6 Conducted Spurious Emissions (Non-Restricted Band)

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway Kona Photon Gateway
Test Personnel: Janet Mijares	Standard: FCC PART 15.247
Date: 2024-07-22 (25.5°C, 41.8% RH)	Basic Standard: ANSI C63.4-2014 FCC OET KDB 558470 v04 DTS

EUT status: Compliant

Specification: FCC Part 15.247(d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

2.6.1 Test Guidance: ANSI C63.10-2013, Clause 6.7

This measurement is performed at the low, mid and high frequencies, with modulation. The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

The spectrum analyzer is stepped through the spectrum in frequency spans selected to ensure acceptable frequency resolution. The RBW is set to 100 kHz. The VBW is set to ≥ 300 kHz. The Peak detector is used, with the trace set to Max Hold.

2.6.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

2.6.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date	Cal. Due

2.7 EUT Positioning Assessment

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway Kona Photon Gateway
Test Personnel:	Standard: FCC PART 15.247
Date:	Basic Standard: ANSI C63.4-2014
Comments: N/A (EUT will be install on 1 fix position)	

Specification: ANSI C63.4-2014, Clause 6.3.2.1

Portable, small, lightweight, or modular devices that may be handheld, worn on the body, or placed on a table during operation shall be positioned on a non-conducting platform, the top of which is 80 cm above the reference ground plane. The preferred area occupied by the EUT arrangement is 1 m by 1.5 m, but it may be larger or smaller to accommodate various sized EUTs (see Figure 6, Figure 7, and Figure 9). For testing purposes, ceiling- and wall-mounted devices also shall be positioned on a tabletop (see also 6.3.4 and 6.3.5). In making any tests involving handheld, body-worn, or ceiling-mounted equipment, it is essential to recognize that the measured levels may be dependent on the orientation (attitude) of the three orthogonal axes of the EUT. Thus, exploratory tests as specified in 8.3.1 shall be carried out for various axes orientations to determine the attitude having maximum or near-maximum emission level.

2.8 Radiated Spurious Emissions (within restricted band/Co-location)

Test Lab: Electronics Test Centre, Airdrie	EUT: Kona Enterprise Gateway
Test Personnel: Janet Mijares /Brendan Van Hee	Kona Photon Gateway
Imran Akram	Standard: FCC PART 15.247/15.209
Date: 2024-07-25/26 (21.0° C,34.1 % RH)	Basic Standard: ANSI C63.10-2013
2024-08-2/5 (23.2° C,42.7 % RH)	
2024-10-25 (20.7° C,32.7 % RH)	
EUT status: Compliant	

Specification: FCC PART 15.247(d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Restricted Bands of Operation:

*** Canada 960 – 1427 MHz

**** Canada only

2.8.1 Test Guidance: ANSI C63.10-2013, Clause 13.4.2

From 9 kHz to 150 kHz (resolution bandwidth of 200 Hz) and from 150 kHz to 30 MHz (resolution bandwidth 9 kHz) measurements are performed with a loop antenna (as per KDB 460108).

From 30 MHz to 1000 MHz, measurements are performed with a broadband biconilog antenna and a resolution bandwidth of 120 kHz.

Above 1000 MHz, measurements are performed with a DRG Horn antenna or a Standard Gain horn, and a resolution bandwidth of 1 MHz The EUT is raised to 150 cm above the ground plane, and the area between the EUT and the antenna mast is covered with RF absorbent material.

The scan is performed at discreet increments of turntable azimuth and antenna height, which are selected in accordance with the applicable standard in order to assure capture of frequencies of interest. Optimization is performed based on the scan data.

Frequencies having peak emissions within 10dB of the limits are optimized. The EUT is rotated in azimuth over 360 degrees and the direction of maximum emission is noted.

Antenna height is varied from 1 – 4 meters at this azimuth to obtain the maximum emission. Then the maximum level is measured with the appropriate detector and recorded. Up to 1 GHz, measurements are performed with a Quasi-Peak detector. Above 1 GHz, measurements are recorded with Peak and/or Average detectors, as applicable.

2.8.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

2.8.3 Test Equipment

2.8.4 Test Sample Verification, Configuration & Modifications

The EUT was set to a selected channel with test-specific software. The output was modulated as in normal operation. LoRa radio is transmitting at high channel for Enterprise and mid channel for Photon. LoRa and LTE was transmitting simultaneously.

The EUT met the requirements without modification.

Test setup diagram for Radiated Spurious Emissions testing (below 1GHz):

Test setup diagram for Radiated Spurious Emissions testing (above 1GHz):

2.8.5 Radiated Emissions Data: Enterprise (Both LTE/LoRa transmitting simultaneously with external antenna)

The emissions data are presented in tabular form, showing turntable azimuth, antenna height and polarization, the uncorrected spectrum analyzer reading, the correction factors applied, the net result, the value of the limit at the frequency investigated, and the Delta between the result and the limit.

Meter Reading in dBμV + Antenna Factor in dB/m + Gain/Loss Factor in dB = Corrected Field Strength in dBμV/m.

Delta = Field Strength – Limit

Notes:

- When a preamp is used, the resulting gain is compensated, producing a negative value for the Cable Loss.
- Measurements reported are the result of adjusting the turntable azimuth and antenna height to obtain the maximum EUT emission. This may produce a different reading than the plot trace. The plot is a Peak Hold function obtained at discreet increments of height and azimuth, while the reported measurement is obtained with the appropriate Quasi Peak or Average detector after the height and azimuth have been adjusted for maximum emission.
- Preliminary scans were performed for all channels in Transmit modes. The High band channel 927.5 MHz was selected as the worst-case condition for detailed examination.
- In Transmit mode, the EUT was assessed up to 10.0 GHz.

Negative values for Delta indicate compliance.

2.8.6 Radiated Emissions Data: Enterprise (Both LTE/LoRa transmitting simultaneously with internal antenna)

The emissions data are presented in tabular form, showing turntable azimuth, antenna height and polarization, the uncorrected spectrum analyzer reading, the correction factors applied, the net result, the value of the limit at the frequency investigated, and the Delta between the result and the limit.

Meter Reading in dBμV + Antenna Factor in dB/m + Gain/Loss Factor in dB = Corrected Field Strength in dBμV/m.

Delta = Field Strength – Limit

Notes:

- When a preamp is used, the resulting gain is compensated, producing a negative value for the Cable Loss.
- Measurements reported are the result of adjusting the turntable azimuth and antenna height to obtain the maximum EUT emission. This may produce a different reading than the plot trace. The plot is a Peak Hold function obtained at discreet increments of height and azimuth, while the reported measurement is obtained with the appropriate Quasi Peak or Average detector after the height and azimuth have been adjusted for maximum emission.
- Preliminary scans were performed for all channels in Transmit modes. The High band channel 927.5 MHz was selected as the worst-case condition for detailed examination.
- In Transmit mode, the EUT was assessed up to 10.0 GHz.

Negative values for Delta indicate compliance.

2.9 Radiated Emissions (RX Mode)

Test Lab: Electronics Test Centre, Airdrie Test Personnel: Janet Mijares Date: 2024/07/26-30 (23.8° C, 39.7% RH) 2024/08/02 (23.0° C, 33.8% RH)	EUT: Kona Enterprise Gateway Kona Photon Gateway Standard: FCC Part 15.109 Basic Standard: ANSI C63.4: 2014 Class: A
EUT status: Compliant	

Frequency (MHz)	FCC Part 15.109 Class A Limit (3m)
30 – 88	49.54 (dBµV/m)
88 – 216	53.98 (dBµV/m)
216 – 960	56.90 (dBµV/m)
Above 960	60.0 (dBµV/m)

Criteria: The radiated emissions produced by a device, measured at a distance of 3 meters, shall not exceed the limits as specified.

2.9.1 Test Guidance:

From 30 MHz to 1000 MHz, measurements are performed with a broadband biconilog antenna and a resolution bandwidth of 120 kHz.

Above 1000 MHz, measurements are performed with a DRG Horn antenna or a Standard Gain horn, and a resolution bandwidth of 1 MHz.

The scan is performed at discreet increments of turntable azimuth and stepped antenna height, with peak detector and Max Hold function which are selected in accordance with the applicable standard in order to assure capture of frequencies of interest. Optimization is performed based on the scan data.

After the pre-scan is completed, the frequencies of interest are optimized. The EUT is rotated in azimuth over 360 degrees and the direction of maximum emission is noted.

Antenna height is varied from 1 – 4 meters at this azimuth to obtain the maximum emission. Then the maximum level is measured with the appropriate detector and recorded. This may produce a different reading than the pre scan trace. Up to 1 GHz, measurements are performed with a Quasi-Peak detector. Above 1 GHz, measurements are recorded with Peak and/or Average detectors, as applicable.

2.9.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

2.9.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date (yyyy-mm-dd)	Cal. Due (yyyy-mm-dd)

2.9.4 Test Sample Verification, Configuration & Modifications

To cover the unintentional radiated emission. The EUT was configured in receive mode. Unit was placed at the center of turntable in semi-anechoic chamber 80cm above the ground plane and at a distance of 3m from the test receive antenna.

The EUT met the requirements without modification. EUTs were powered with POE and internal battery for Enterprise and Photon respectively.

2.10 RF Exposure

Test Lab: Electronics Test Centre, Airdrie

EUT: Kona Enterprise Gateway
Kona Photon Gateway

Test Personnel:

Standard: FCC PART 15.247

Date:

EUT status: Exempt from SAR Evaluation

Compliant: RF exposure assessment to be provided in a separate Exhibit.

3.0 TEST FACILITY

3.1 Location

The Kona Enterprise Gateway & Kona Photon Gateway was tested at the Electronics Test Centre laboratory located in Airdrie, Alberta, Canada. The Radio Frequency Anechoic Chamber (RFAC), identified as Chamber 1, has a usable working space measuring 10.6 m long x 7.3 m wide x 6.5 m high.

Measurements taken at this site are accepted by Industry Canada as evidence of conformity per registration file # 2046A. This site is also listed with the FCC under Registration Number CA2046.

The floor, walls and ceiling consist of annealed steel panels. The walls and ceiling are covered with ferrite tile, augmented by RF absorbant foam material on the end wall nearest the turntable, and on the adjacent walls and the ceiling. The chamber floor supports a 15 cm high internal floor, constructed of annealed steel panels, that forms the ground plane, and is bonded to the chamber walls.

The 3-m diameter turntable is flush-mounted with the floor. A sub-floor cable-way is provided to route cables between the turntable pit and EUT support equipment located in the Control Room. Cables reach the EUT through an opening in the centre of the turntable.

Test instrumentation and EUT support equipment is located in the Control Room, consisting of two shielded vestibules joined together at the side of the main room. Cables are routed through bulkhead panels between the rooms and the test chamber as required. Power feeds are routed into the main room and vestibules through line filters providing at least 100 dB of attenuation between 10 kHz and 10 GHz.

Either floor mounted or table-top equipment can be tested at this facility.

3.2 Grounding Plan

The Kona Enterprise Gateway was placed at the center of the test chamber turntable 80-cm high below 1GHz and at 1.5m high above 1 GHz for transmits mode and 80cm high for RX mode from ground reference plane. The Kona Enterprise Gateway & Kona Photon Gateway earth ground is connected to GRP.

3.3 Power Supply

Power supplied via POE for Kona Enterprise Gateway and Kona Photon Gateway is powered via internal battery.
