Inquiry:

Dear Sirs,

I've an

inquiry with the expectation to your guidance on that. It is about Part 15Rx equipment subject to certification approval. As I enclosed the material of user's manual, and op.des for your reference. 2.4GHz receiver as the wireless microphone. Under the table of the category in 15.101, the receiver with part 15 could select its conformity procedure as DoC or Certification. However, while examining the available equipment class, CYY looks to be more fittable, but it is under A1, meaning frequency must be lower than 1GHz. If looking to 15B above 1GHz (A2), only CRD is available, but it is Radar detector which is not appropriate to fit the type of attached equipment. For other code, such as JBP w/o having to input the frequency on 731 filing system, may not be proper to this equipment, cause this device has no proper I/O to be categorized as class B computer peripheral. What would be the proper code (equipment class) to be selected if the applicant would like this Receiver to be adapted to certification as its conformity procedure?

Best
Regards,

Mark Chung

FCC response on

From the information that you have submitted, the equipment classification for a wireless microphone system is

DWMPart 15 Wireless Microphone 15C
