

Hampton Products International Corporation

REVISED TEST REPORT FOR

ARRAY, WiFi™* SMART DEADBOLT
Model: 23500-125

Tested to The Following Standards:

FCC Part 15 Subpart C Section(s)

15.247
(DTS 2400-2483.5 MHz)

Report No.: 100170-8A

Date of issue: October 27, 2017

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

* Wi-Fi® is a registered trademark of Wi-Fi Alliance®.

This report contains a total of 76 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc.

Mariposa, CA 95338

Project Number: 100170

DATE OF EQUIPMENT RECEIPT:

September 27, 2017

DATE(S) OF TESTING:

September 27, 2017 -October 1, 2017

Revision History

Original: Testing of the ARRAY, WiFi™ SMART DEADBOLT, Model: 23500-125 to FCC Part 15 Subpart C Section(s) 15.247 (DTS 2400-2483.5 MHz)

Revision A: To clarify conducted Band Edge data, BE Summary table was revised and statement added over BE plots.

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S):

SUMMARY OF RESULTS

Standard / Specification: FCC Part 15 Subpart C - 15.247 (DTS)

Test Procedure	Description	Modifications	Results
15.247(a)(2)	6dB Bandwidth	NA	Pass
15.247(b)(3)	Output Power	NA	Pass
15.247(e)	Power Spectral Density	NA	Pass
15.247(d)	RF Conducted Emissions & Band Edge	NA	Pass
15.247(d)	Radiated Emissions & Band Edge	NA	Pass

NA = Not Applicable

Modifications During Testing

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions
No modifications were made during testing.

Modifications listed above must be incorporated into all production units.

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions
None

EQUIPMENT UNDER TEST (EUT)

The following device/model has been tested by CKC Laboratories:

ARRAY, WiFi™ SMART DEADBOLT, Model: 23500-125

The manufacturer states that the following additional models are identical electrically to the one which was tested, or any differences between them do not affect their EMC characteristics, and therefore they meet the level of testing equivalent to the tested models.

Model Number	Style and Finish Description
23500-125	Cooper (modern style) in Polished Chrome
23500-119	Cooper (modern style) in Satin Nickel
23500-150	Cooper (modern style) in Tuscan Bronze
23501-119	Barrington (transitional style) in Satin Nickel
23501-125	Barrington (transitional style) in Polished Chrome
23501-150	Barrington (transitional style) in Tuscan Bronze

During testing, numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

Configuration 1

Equipment Tested:

Device	Manufacturer	Model #	S/N
ARRAY, WiFi™ SMART DEADBOLT	Hampton Products International Corporation	23500-125	NA

Support Equipment:

Device	Manufacturer	Model #	S/N
Laptop	ASUS	UX330U	GAN0WU046001418
USB to Serial Interface	Skyworks	EN40-D405-001	NA

General Product Information:

Product Information	Manufacturer-Provided Details
Equipment Type:	Stand-Alone Equipment
Type of Wideband System:	802.11b/g/n20
Operating Frequency Range:	2412MHz to 2462MHz
Modulation Type(s):	DSSS, CCK, OFDM, BPSK, QPSK, 16-QAM, 64-QAM
Maximum Duty Cycle:	>=98%
Number of TX Chains:	1
Antenna Type(s) and Gain:	PIFA, 2.1dBi
Beamforming Type:	N/A
Antenna Connection Type:	Integral
Nominal Input Voltage:	3.7Vdc
Firmware / Software used for Test:	Lock 1.42 WiFi [™] /Ayla 2.49

FCC Part 15 Subpart C

15.247(a)(2) 6dB Bandwidth

Test Setup/Conditions			
Test Location:	Brea Lab A	Test Engineer:	S. Yamamoto
Test Method:	ANSI C63.10 (2013), KDB 558074 D01 v04 April 5, 2017	Test Date(s):	9/27/2017
Configuration:	1		
Test Setup:	Frequency Range: 2412MHz to 2462MHz Frequency tested: 2412MHz, 2437MHz, 2462MHz Firmware power setting: 802.11b=17, 802.11g=15, 802.11n20=14 EUT Firmware: Lock 1.42 WiFi™/Ayla 2.49 Protocol /MCS/Modulation: DSSS, CCK, OFDM, BPSK, QPSK, 16-QAM, 64-QAM Antenna type: PIFA Antenna Gain: 2.1dBi. Duty Cycle: 802.11b=97.1, 802.11g=98.0, 802.11n20=97.9 Test Method: KDB 558074 D01 v04 D01 v04 April 5, 2017 Option 2 Test Mode: Continuous transmit Test Setup: The equipment under test (EUT) output is connected to the spectrum analyzer using a coaxial cable and attenuator. A laptop is connected to the EUT in order to set the EUT to specific settings required for testing. A new battery is installed in the EUT. Modifications added: None Setup: Site A control room

2462	BPSK / 1	NA	13.5	NA	0

Test performed using operational mode with the highest output power, representing worst case.

Test Data Summary - Voltage Variations

This equipment is battery powered and manufacturer declares the equipment cannot operate while charging. The battery is separated from the product during charge cycle.
Power output tests were performed using a fresh battery.

Power Output Test Data Summary - RF Conducted Measurement						
Measurement Option: AVGSA-2						
Frequency (MHz)	Modulation	Ant. Type / Gain (dBi)	Measured (dBm)	DCCF (dB)	Limit (dBm)	Results
2412	CCK	PIFA / 2.1	17.2	0.1	≤ 30	Pass
2437	CCK	PIFA / 2.1	17.3	0.1	≤ 30	Pass

Test Location: CKC Laboratories • 100 North Olinda Place • Brea CA 92823 • 714 993-6112
 Customer: **Hampton Products International Corporation**
 Specification: **15.247(d) / 15.209 Radiated Spurious Emissions**
 Work Order #: **100170** Date: 10/1/2017
 Test Type: **Maximized Emissions** Time: 10:11:51
 Tested By: S. Yamamoto Sequence#: 1
 Software: EMITest 5.03.02

Equipment Tested:

Device	Manufacturer	Model #	S/N
Configuration 1			

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 1			

Test Conditions / Notes:

Frequency Range: 9kHz to 25GHz Frequency tested: 2412MHz, 2437MHz, 2462MHz Firmware power setting: 802.11n20=14 Duty Cycle: 802.11b=97.9 Test Method: KDB 558074 D01 v04 April 5, 2017 ANSI C63.10 2013 Test Mode: Continuous transmit Test Setup: The equipment under test (EUT) is stand alone on the Styrofoam table top. A laptop is connected to the EUT in order to set it to specific settings required for testing and then disconnected and removed from the test area. A new battery is installed in the EUT. Temperature (°C): 22 Relative Humidity (%): 41 Modifications added: None Setup: Site A OATS

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of $k=2$. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $\text{dB}\mu\text{V}/\text{m}$, the spectrum analyzer reading in $\text{dB}\mu\text{V}$ was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS		
	Meter reading	($\text{dB}\mu\text{V}$)
+	Antenna Factor	(dB/m)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	($\text{dB}\mu\text{V}/\text{m}$)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
