Note: 10-g Extremity SAR Test Exclusion Power Thresholds are 2.5 times higher than the 1-g SAR Test Exclusion Thresholds indicated above. These thresholds do not apply, by extrapolation or other means, to occupational exposure limits.

Alternatively, for 100 MHz to 6 GHz and test separation distances ≤ 50 mm, the 1-g and 10-g SAR test exclusion thresholds are determined by the following: $[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$ for 1-g SAR, and ≤ 7.5 for 10-g extremity SAR. When the minimum test separation distance is < 2 mm, where a distance of 2 mm is applied to determine SAR test exclusion. The max output power is reference to report number: **EM-F170801**.

| Frequency (GHz) | Max Output Power (mW) | Tune-up factor | Tune-up max power (mW) | Min. distance (mm) | Exclusion Threshold |
|-----------------|-----------------------|----------------|------------------------|--------------------|---------------------|
| 2.4 | 0.158 | 1.01 | 0.16 | 2 | 0.1239 |

Since the exclusion threshold calculated is **0.1239** < 7.5 , thus SAR test is exclusion.
