The radio utilizes a SMD chip antenna, with a maximum gain of -0.5dBi.

5.4. SOFTWARE AND FIRMWARE

The firmware installed in the EUT during testing was 9
The test utility software used during testing was Tera Term Ver 4.93.

5.5. WORST-CASE CONFIGURATION AND MODE

Radiated emission from 9KHz to 1000 MHz was performed with the EUT set to transmit at the channel with highest output power as worst-case scenario.

Radiated emission from 1000MHz to 18GHz was performed with the EUT set to transmit at the Mid channel as worst-case scenario; after low and high channels were investigated.

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required.
