ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 15C and ISED Canada RSS-210 and ISED Canada RSS-GEN. The sample tested was found to comply with the requirements defined in the applied rules.

1.4 Product Information

1.4.1 Technical Description

EUT is a Access Point for Data Communication with a Security Lock on 919 MHz.

EUT has configured for testing as follows:

- Mode: Continuous Transmission of Random Packet Data
- RF-Power: -2.5 dBm
- Frequency: 919 MHz (FCC-Testing)
- Packet Length: 60 Bytes

1.5 Deviations from the Standard

1.6 EUT Modification Record

The table below details modifications made to the EUT during the test programme.
The modifications incorporated during each test are recorded on the appropriate test pages.

2 Test Details

2.1 Authorised Band Edges

2.1.1 Specification Reference

FCC 47 CFR Part 15C, ISED Canada RSS-210 and ISED Canada RSS-GEN, Clause 15.249 (a), B.10(b) and N/A.

2.1.2 Equipment Under Test and Modification State

AP500, S/N: 4 000 999 001 - Modification State 0

2.1.3 Date of Test

2018-05-22

2.1.4 Test Method

The test was performed in accordance with ANSI C63.10, clause 6.3, 6.5 and 6.6.

2.1.5 Environmental Conditions

Ambient Temperature	23.0 °C
Relative Humidity	44.0 %

2.1.6 Test Results

UHF Transmitting, with modulation

No emission above -50 dBc or above § 15.209 limit detected at band edges. See chapter 2.3 “Field Strength of any Emission”

FCC 47 CFR Part 15, Limit Clause 15.249 (d)

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in § 15.209, whichever is the lesser attenuation.

FCC 47 CFR Part 15, Limit Clause 15.209

Frequency (MHz)	Field Strength (µV/m at 3 m)

Above 960	500

Table 5

ISED Canada RSS-210, Limit Clause B.10 (b)

Emissions radiated outside of the specified frequency bands, except for harmonic emissions, shall be attenuated by at least 50 dB below the level of the fundamental emissions or to the general field strength limits listed in RSS-Gen, whichever is less stringent.

ISED Canada RSS-GEN, Limit Clause 8.9

Frequency (MHz)	Field Strength (µV/m at 3 m)
30 to 88	100
88 to 216	150
216 to 960	200

2.3.3 Date of Test

2018-05-25 to 2018-06-20

2.3.4 Test Method

This test was performed in accordance with ANSI C63.10, clause 6.3, 6.4 and 6.5. and ISED Canada RSS-Gen clause 6.13.

Measurements were made at a distance of 3 m. The limit lines shown on the plot were extrapolated from either 300 m or 30 m to the measurement distance of 3 m in accordance with ANSI C63.10 Clause 6.4.4.2.

For any emissions detected within 20 dB of the limit, a final measurement was made and recorded in the table below. The detector used for these measurements was a quasi-peak detector except for emissions within the bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where a CISPR average detector was used.

2.7.5 Test Results

Exposure of Humans to RF Fields	Applicable	Declared by applicant	Measured	Exemption
The antenna is				
☒ detachable				
The conducted output power (CP in watts) is measured at the antenna connector: $CP = \dots\dots\dots \text{ W}$ The effective isotropic radiated power (EIRP in watts) is calculated using ☐ the numerical antenna gain: $G = \dots\dots\dots$ $EIRP = G \cdot CP \Rightarrow EIRP = \dots\dots\dots \text{ W}$ ☒ the field strength¹ in V/m: $FS = 0.034 \text{ V/m}$ $EIRP = \frac{(FS \cdot D)^2}{30} \Rightarrow EIRP = 0.35 \text{ mW}$ with: Distance between the antennas in m: $D = 3$			☐	
☐ not detachable				
A field strength measurement is used to determine the effective isotropic radiated power (EIRP in watts) given by:				
$EIRP = \frac{(FS \cdot D)^2}{30} \Rightarrow EIRP =$ with: Field strength in V/m: $FS =$ Distance between the two antennas in m: $D =$			☐	
Selection of output power				
The output power TP is the higher of the conducted or effective isotropic radiated power (e.i.r.p.): $TP = 0.35 \text{ mW}$				

¹ The conversion formula is valid only for properly matched antennas. In other cases the transmitter output power may have to be measured by a terminated measurement when applying the exemption clauses.

If an open area test site is used for field strength measurement, the effect due to the metal ground reflecting plane should be subtracted from the maximum field strength value in order to reference it to free space, before calculating TP.

Exposure of Humans to RF Fields (continued)											Applicable	Declared by applicant	Measured	Exemption																																																																																																		
Separation distance between the user and the transmitting device is																																																																																																																
☒ less than or equal to 20 cm ☐ greater than 20 cm												☐																																																																																																				
Transmitting device is																																																																																																																
☐ in the vicinity of the human head ☐ body-worn												☐																																																																																																				
SAR evaluation																																																																																																																
SAR evaluation is required if the separation distance between the user and/or bystander and the antenna and/or radiating element of the device is less than or equal to 20 cm, except when the device operates at or below the applicable output power level (adjusted for tune-up tolerance) for the specified separation distance defined in the table. For controlled use devices where the 8 W/kg for 1 gram of tissue applies, the exemption limits for routine evaluation in the table are multiplied by a factor of 5. For limb-worn devices where the 10 gram value applies, the exemption limits for routine evaluation in the table are multiplied by a factor of 2.5. If the operating frequency of the device is between two frequencies located in the table, linear interpolation shall be applied for the applicable separation distance. For test separation distance less than 5 mm, the exemption limits for a separation distance of 5 mm can be applied to determine if a routine evaluation is required. For medical implants devices, the exemption limit for routine evaluation is set at 1 mW. The output power of a medical implants device is defined as the higher of the conducted or e.i.r.p to determine whether the device is exempt from the SAR evaluation. <table border="1"> <thead> <tr> <th rowspan="2">Frequency (MHz)</th> <th colspan="10">Exemption limits (mW)² at separation distance of</th> </tr> <tr> <th>≤5 mm</th> <th>10 mm</th> <th>15 mm</th> <th>20 mm</th> <th>25 mm</th> <th>30 mm</th> <th>35 mm</th> <th>40 mm</th> <th>45 mm</th> <th>≥50 mm</th> </tr> </thead> <tbody> <tr> <td>≤300³</td> <td>71</td> <td>101</td> <td>132</td> <td>162</td> <td>193</td> <td>223</td> <td>254</td> <td>284</td> <td>315</td> <td>345</td> </tr> <tr> <td>450</td> <td>52</td> <td>70</td> <td>88</td> <td>106</td> <td>123</td> <td>141</td> <td>159</td> <td>177</td> <td>195</td> <td>213</td> </tr> <tr> <td>835</td> <td>17</td> <td>30</td> <td>42</td> <td>55</td> <td>67</td> <td>80</td> <td>92</td> <td>105</td> <td>117</td> <td>130</td> </tr> <tr> <td>1900</td> <td>7</td> <td>10</td> <td>18</td> <td>34</td> <td>60</td> <td>99</td> <td>153</td> <td>225</td> <td>316</td> <td>431</td> </tr> <tr> <td>2450</td> <td>4</td> <td>7</td> <td>15</td> <td>30</td> <td>52</td> <td>83</td> <td>123</td> <td>173</td> <td>235</td> <td>309</td> </tr> <tr> <td>3500</td> <td>2</td> <td>6</td> <td>16</td> <td>32</td> <td>55</td> <td>86</td> <td>124</td> <td>170</td> <td>225</td> <td>290</td> </tr> <tr> <td>5800</td> <td>1</td> <td>6</td> <td>15</td> <td>27</td> <td>41</td> <td>56</td> <td>71</td> <td>85</td> <td>97</td> <td>106</td> </tr> </tbody> </table>											Frequency (MHz)	Exemption limits (mW) ² at separation distance of										≤5 mm	10 mm	15 mm	20 mm	25 mm	30 mm	35 mm	40 mm	45 mm	≥50 mm	≤300 ³	71	101	132	162	193	223	254	284	315	345	450	52	70	88	106	123	141	159	177	195	213	835	17	30	42	55	67	80	92	105	117	130	1900	7	10	18	34	60	99	153	225	316	431	2450	4	7	15	30	52	83	123	173	235	309	3500	2	6	16	32	55	86	124	170	225	290	5800	1	6	15	27	41	56	71	85	97	106

² The exemption limit in the table are based on measurements and simulations on half-wave dipole antennas at separation distances of 5 mm to 25 mm from a flat phantom, providing a SAR value of approximately 0.4 W/kg for 1 g of tissue. For low frequencies (300 MHz to 835 MHz), the exemption limits are derived from a linear fit. For high frequencies (1900 MHz and above), the exemption limits are derived from a third order polynomial fit.

³ Transmitters operating between 3 kHz and 10 MHz, meeting the exemption from routine SAR evaluation, shall demonstrate compliance to the instantaneous limits in IC RSS-102, issue 5, section 4.

Table 22

Note 1:

The expanded uncertainty reported according to CISPR 16-4-2:2003-11 is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 2:

The expanded uncertainty reported according to UKAS Lab 34 (Edition 1, 2002-08) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 3:

The expanded uncertainty reported according to UKAS Lab 34 (Edition 1, 2002-08) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2.05$, providing a level of confidence of $p = 95.45\%$

Note 4:

It has been demonstrated that the used test equipment meets the specified requirements in the standard with at least a 95% confidence.

Note 5:

The expanded uncertainty reported according to IEC 61000-4-3 is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 6:

The expanded uncertainty reported according to IEC 61000-4-6 is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 7:

The expanded uncertainty reported according to ETSI TR 100 028 V1.4.1 (all parts) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 1.96$, providing a level of confidence of $p = 95.45\%$

Note 8:

The expanded uncertainty reported according to ETSI TR 102 273 V1.2.1 (all parts) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 1.96$, providing a level of confidence of $p = 95.45\%$
