1 General Information

1.1 Purpose of this Report

This report is prepared to show that the OKYANUS TEKNOLOJİ BİLGİSAYAR VE YAZILIM SAN. TİC. Model MT-02DCIS complies with the FCC Rules and Regulations of Part 15.519, Technical requirements for handheld UWB systems.

1.2 Characterization of Test Sample

The sample used for testing was received by US Tech on July 25, 2019 in good operating condition.

1.3 Product Description

The Equipment under Test (EUT) is the Okyanus Teknoloji Bilgisaryar ve Yazilim San. Tic. Model MT-02DCIS mobile tag. The EUT is a member of Wipelot solution family. Mobiles send signals to the high precision readers within the system to find the distance between mobile and readers. Also, Mobiles send signals to all fixed readers to transmit emergency situations on the mobiles.

The EUT incorporates two different wireless radio technologies. The first is a 2.4 GHz ISM band radio utilizing IEEE 802.15.4 technology the second is a radio that utilizes Ultra Wide Band technology. This evaluation is for the UWB radio feature.

1.4 Configuration of Tested System

The Test Sample was tested per *ANSI C63.10:2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices* (2013) and per FCC Part 15 Subpart F.

A list of EUT and Peripherals is found in Table 1 following. A block diagram of the tested system is shown in Figure 1. Test configuration photographs are provided in separate Appendices.

1.5 Test Facility

Testing was performed at US Tech's measurement facility at 3505 Francis Circle, Alpharetta, GA 30004. This site has been fully described and registered with the FCC, with designation number 186022.

MT-02DCIS

1.6 Related Submittals

The EUT is subject to the following FCC Equipment Authorizations:

- a) Certification as a UWB Device under FCC Part 15.519; see test data presented herein.
- b) Certification as a DTS Device under FCC Part 15.247; test report and application submitted separately.
- c) Verification as a class B digital device.

The verification requirement shares many common report elements with the certification report therefore though this report is mostly intended to provide data for the certification process this data can also be used to show compliance to the requirements of the verification limits under Part 15 Subpart B.

2.2 Modifications to EUT Hardware

No physical modifications were made by US Tech in order to bring the EUT into compliance with FCC Part 15, Subpart F Intentional Radiator Limits for the transmitter portion of the EUT.

2.3 Frequency Range of Radiated Measurements (Part 15.33, 15.521(h))

2.3.1 Intentional Radiator

The spectrum shall be investigated for the intentional radiator from the lowest RF signal generated in the EUT, without going below 9 kHz to the 5th harmonic of the peak level of fundamental frequency generated or 40 GHz, whichever is the lowest.

The highest frequency used to determine the frequency range over which measurements are made shall be based on the center frequency (fc). If the center frequency is less than 10 GHz there is no requirement to measure beyond 40 GHz.

2.4 Measurement Detector Function and Bandwidth (CFR 15.35)

The radiated emissions limits shown herein are based on the following:
FCC Part 15.209, 15.519

2.4.1 Detector Function and Associated Bandwidth

On frequencies below 1000 MHz, the limits herein are based upon measurement equipment employing a CISPR Quasi-peak detector function and related measurement bandwidths (i.e. 9 kHz from 150 kHz to 30 MHz and 120 kHz from 30 MHz to 1000 MHz). Alternatively, measurements may be made with equipment employing a peak detector function as long as the same bandwidths specified for the Quasi-peak device are used.

2.4.2 Corresponding Peak and Average Requirements

Above 1000 MHz, radiated limits are based on measuring instrumentation employing an average detector function. When average radiated emissions are specified there is also a corresponding Peak requirement, as measured using a peak detector, of 20 dB greater than the average limit. For all measurements above 1000 MHz the Resolution Bandwidth shall be at least 1 MHz.

2.5 EUT Antenna Requirements (CFR 15.203)

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. Only the antenna(s) listed in Table 4 will be used with this module.

Table 3. Allowed Antenna(s)

MT-02DCIS

2.6 Restricted Bands of Operation (Part 15.205)

Only spurious emissions can fall in the frequency bands of CFR 15.205. The field strength of these spurious cannot exceed the limits of 15.209. Radiated harmonics and other Spurious are examined for this requirement see paragraph 2.1

2.7 Intentional Radiator, Power Line Conducted Emissions (CFR 15.207)

The EUT is battery powered. The EUT is indirectly connected the AC mains for testing purposes only. During normal operation the EUT is battery powered and will not be operated while directly or indirectly connected to the AC mains. This test was not applicable.

2.8 Intentional Radiator, Radiated Emissions (CFR 15.519 (f), 15.521 (g))

UWB devices where the highest radiated emission, f_M (the frequency at which the highest radiated emission occurs), is above 960 MHz have a limit on the peak level of the emission within a 50 MHz bandwidth of 0 dBm EIRP. A different RBW was used, therefore the peak emissions limit was adjusted per CFR 15.521 (g). The limit was also converted to peak field strength at 3 meters.

The antenna was positioned as it would be in normal operation and the fundamental emission was maximized to ensure the maximum reading and measured with the receiving antenna in both horizontal and vertical position. Below is the measured peak radiated emission at 3 meters.

RBW used: 5 MHz

$$\begin{aligned}\text{Peak EIRP Limit} &= 20 \log (\text{RBW}/50) \text{dBm EIRP} \\ &= 20 \log(5/50) \text{ dBm EIRP} \\ &= -20 \text{ dBm EIRP}\end{aligned}$$

$$\begin{aligned}\text{Peak Field Strength Limit} &= -20 \text{ dBm EIRP} + 95.2 \\ &= 75.2 \text{ dBuV/m}\end{aligned}$$

Note: The EUT was programmed to transmit at a power level setting of 8 for all emissions testing. This is the maximum power permitted by programming which can only be done by the grantee. The end user or buyer of the equipment has no access to programming software.

2.8.1 Pulse Repetition Frequency and Duty Cycle

The device employs pulse modulation and has a repetition rate of 8.7 Hz. The pulse signal has been verified below. The plots below show the TX ON and TX OFF times. This data was used to calculate the pulse rate and Duty Cycle correction factor.

Pulse Rate: 8.7 Hz

Period= 115 mSec

Frequency= 1/seconds= 1/0.115 secs = 8.7 Hz

Duty Cycle correction factor: -27.4 dB

$20 \log (T_{X_{on}}/T_{X_{on}}+T_{X_{off}}) = 20 \log (5.000\text{ms}/117.5\text{ms}) = -27.4 \text{ dB}$

2.9 UWB Bandwidth (CFR 15.519(b), 15.521(e), RSS-220 Section 6.2.1(a))

Bandwidth measurements were made in accordance with ANSI C63.10-2013 Clause 10.1. The bandwidth of an handheld UWB system under 15.519 must be below 10.6 GHz. The bandwidth is defined as the frequency band bounded by the points that are 10 db below the highest radiated emissions, as based on the complete transmission system including the antenna. The upper boundary is designated f_H and the lower boundary is designated f_L . The frequency at which the highest radiated emission occurs is designated f_M . If multiple bandwidths occur, then the maximum bandwidth is used.

The bandwidth was determined from a radiated measurement using the designated antenna with which EUT will operate in the final product. The receiving antenna's height was repeatedly varied from 1 m to 4 m and the polarity was adjusted several times. The turn table on which the EUT was placed was also rotated several times. This ensured that the true bandwidth of the EUT was measured. Below is the measured UWB bandwidth with the receiving antenna horizontal and vertical. Both polarities met the 10.6 GHz limit.

Bandwidth emissions are contained within 3.1 GHz to 10.6 GHz which meets the requirements of 15.519(b).

Per 15.503 (d) *Ultra-wideband (UWB) transmitter*. An intentional radiator that, at any point in time, has a fractional bandwidth equal to or greater than 0.20 or has a UWB bandwidth equal to or greater than 500 MHz, regardless of the fractional bandwidth.

The fractional bandwidth as calculated below is less than 0.20 however the UWB bandwidth is greater than 500 MHz therefore the EUT meets this requirement.

MT-02DCIS

Figure 5. UWB f_L , f_M , f_H Measurement Plot

The EUT fractional bandwidth when calculated using the formula referenced in 15.503(c):

$$2(F_H - F_L) / (F_H + F_L) =$$

$$2(4.773 - 4.200 \text{ GHz}) / (4.773 + 4.200 \text{ GHz}) = 0.127 \text{ (fractional bandwidth).}$$

$$F_C = (F_H + F_L) / 2 = (4.773 + 4.200) / 2 = 4.487 \text{ GHz}$$

2.10 UWB Purpose, Part 90 License, and Coordination (CFR 15.519 (a))

This device is designed to be used only in an handheld infrastructure as detailed in the User Guide provided in the submittal documentation. Without first setting up the network the device will not function as intended. The device is design such that it will not be intentionally directed outside of the building. There are no provisions for the use of outdoor mounting antennas. There are no provisions for the use of field disturbance sensors. The device is design such that it shall transmit only when the intentional radiator is sending information to an associated receiver.

In regards to the following requirements:

A UWB device operating under the provisions of this section shall transmit only when it is sending information to an associated receiver. The UWB intentional radiator shall cease transmission within 10 seconds unless it receives an acknowledgement from the associated receiver that its transmission is being received. An acknowledgment of reception must continue to be received by the UWB intentional radiator at least every 10 seconds or the UWB device must cease transmitting.

The device only broadcasts for 5 mili-seconds and if there is no acknowledgment it goes back to sleep mode. Details are found in the Theory of Operation exhibit for the device.

The use of antennas mounted on outdoor structures, e.g., antennas mounted on the outside of a building or on a telephone pole, or any fixed outdoors infrastructure is prohibited. Antennas may be mounted only on the hand held UWB device.

There are no provisions for the use of outdoor mounting antennas. They system is designed around the use of transceiver devices that have their own integral antennas. No externally mounted antennas will be necessary for operation.

2.11 Unintentional Radiator, Power line Emissions (CFR 15.207, 15.521 (j))

The power line conducted voltage emission measurements have been carried out in accordance with CFR 15.207, per ANSI C63.10:2013, Clause 6.2, with a spectrum analyzer connected to an LISN and the EUT placed into a continuous Mode of transmission.

The worst-case results for conducted emission was 5.5 dB below the specification limit at 0.4501 MHz on NEUTRAL. All other measured signals were at least 6.2 dB below the specification limit. These results are given in the table following.

2.12 Radiated Emissions at or Below 960 MHz (CFR 15.519(c), 15.209)

The radiated emissions at or below 960 MHz from the transmitter shall not exceed the emissions levels in CFR 15.209. Furthermore the emissions due to the digital circuitry of the EUT must also comply with the limits for 15.109.

Table 6. Radiated Emissions Test Data below 960 MHz

Test By: AF	Test: FCC Part 15.209/517(c)					Client: Okyanus Teknoloji Bilgisayar ve Yazılım San. Tic.			
	Project: 19-0332					Model: MT-02DCIS			
Frequency (MHz)	Test Data (dBuV)	Additional Factors	AF+CL-PA (dB)	Results (dBuV/m)	Limits (dBuV/m)	Distance / Polarization	Margin (dB)	DETECTOR PK / QP/AVG	
All emissions were more than 20 dB below the applicable limit.									

AF is antenna factor. CL is cable loss. PA is preamplifier gain.

2.13 Radiated Emissions above 960 MHz (CFR 15.519(c), 15.521(d,g,h))

The radiated emissions above 960 MHz from the transmitter shall comply with the AVG limits in Table 7 when measured using a resolution bandwidth of 1 MHz. The following are the worst case emissions with the receiving antenna in both horizontal and vertical polarities. The emissions were maximized using a Peak Detector, and the final measurement was taken using an Average Detector.

Table 7. Radiated Emissions above 960 MHz, CFR 15.519(c), 15.521(g)

Frequency Range (MHz)	EIRP Limit (dBm)	Field Strength Limit at 3 meters (dBuV/m)
960 -1610	-75.3	19.9
1610 – 1990	-63.3	31.9
1990 – 3100	-61.3	33.9
3100 - 10600	-41.3	53.9
Above 10600	-61.3	33.9

All emissions were for the EUT in the range above 960 MHz were more than 20 dB below the applicable limits.

2.14 Radiated Emissions in the GPS band (CFR 15.519(d), 15.521(g))

In addition to the radiated emissions limits from CFR 15.519(c), the transmitter shall not exceed the following average limits, in Table 8 when measured using a resolution bandwidth of no less than 1 kHz.

Note: measurements taken with a resolution bandwidth of greater than 1 kHz were corrected using the following equation: recorded measurement (dBuV) + 10 log (RBW_{ref}/RBW_{meas})

Table 9. Radiated Emissions in the GPS band (CFR 15.519 (e), 15.221(g), RSS-220 Section 6.2.1(e))

Frequency Range (MHz)	EIRP Limit (dBm)	Field Strength Limit at 3 meters (dBuV/m)
1164-1240	-85.3	9.9
1559-1610	-85.3	9.9

The EUT was configured according to ANSI C63.10, Clause 10. During the testing the EUT was rotated 360 degrees and the receive antenna was elevated between 1m and 4m to measure and record the maximum emissions being generated by the EUT. The receive antenna was oriented in both the horizontal and vertical polarities. The worst case data is recorded and presented in the tables following.

In each of these bands, the emissions from the transmitter were maximized using a larger bandwidth and the peak detector, then the resolution bandwidth was decreased and the final measurement was taken using the average detector. The spectrum analyzer settings were set to the following parameters:

Frequency start and stop: 1164 MHz to 1240 MHz and 1559 MHz to 1610 MHz. The resolution bandwidth was set to 1 kHz or 3 kHz. When the measurements were performed at 3 kHz a correction factor was used to correct the data collected at 3 kHz back to 1 kHz using the equation noted above. The video bandwidth was set to greater than or equal to the resolution bandwidth. The detector used was Peak or Average. The worse case emissions are seen below.

2.15 Measurement Uncertainty

The measurement uncertainties given were calculated using the method detailed in CISPR 16-4. A coverage factor of $k=2$ was used to give a level of confidence of approximately 95%.

2.15.1 Conducted Emissions Measurement Uncertainty

Measurement Uncertainty (within a 95% confidence level) for this test is ± 2.85 dB.

The data listed in this test report does have sufficient margin to negate the effects of uncertainty. Therefore; the EUT unconditionally meets this requirement.

2.15.2 Radiated Emissions Measurement Uncertainty

For a measurement distance of 3 m the measurement uncertainty (with a 95% confidence level) for this test using a Biconical Antenna (30 MHz to 200 MHz) is ± 5.40 dB. This value includes all elements of measurement.

The measurement uncertainty (with a 95% confidence level) for this test using a Log Periodic Antenna (200 MHz to 1000 MHz) is ± 5.19 dB.

The measurement uncertainty (with a 95% confidence level) for this test using a Horn Antenna is ± 5.20 dB.

The data listed in this test report does have sufficient margin to negate the effects of uncertainty. Therefore; the EUT unconditionally meets this requirement.

END OF TEST REPORT
