2.2 Description of EUT during the test

During the test, keep the EUT in continuously transmitting mode.

There was no mechanical or circuitry modification to improve RF and spurious characteristic, and any RF and spurious suppression device(s) was not added against the device tested.

The EUT was moved throughout the X, Y, and Z axis and worst case data was recorded in this report.

2.5 PRELIMINARY TEST

• Product description and theory of operation

- The TVWS base station is a outdoor unit that transmits independent carriers. Each carrier provides up to 32 Mbps by TVWS channels. The base station is deployed with an external SISO antenna. It is connected to the network through a SFP with AC input. The base station includes an GPS an external antenna. The base station main features include up to 32 Mbps throughput, up to 256 QAM modulation rates in 6 MHz channel bandwidths. The TVWS subscriber unit delivers up to 32 Mbps and includes a directional integrated flat panel antenna for quick and easy installation. TVWS is highly robust, a mandatory requirement for maintaining low operational costs in remote rural networks. The TVWS incorporates an embedded GPS, enabling dynamic spectrum allocation according to the regulation.

3. Measurement data

3.1 Occupied bandwidth

3.1.1 Requirement

- FCC Part15 subpart H , ANSI 63.10 6.9.3

3.1.2 Test Procedure

The occupied bandwidth or the “99% emission bandwidth” is defined as the frequency range between two points, one above and the other below the carrier frequency, within which 99% of the total transmitted power of the fundamental transmitted emission is contained.

Set the analyzer as follows for measuring 99% BW:

1. Set RBW to 1-5 % of OBW
2. Set the VBW $\geq [3 \times \text{RBW}]$.
3. Detector = peak.
4. Trace mode = max hold.
5. Sweep = auto couple.
6. Use instrument 99% BW function to measure BW.

3.1.3 Test environment

- 22 °C, 43 % R.H.

3.1.4 Test results

Frequency [MHz]		Measured Value [MHz]	Limit [MHz]	Result
Low	473	4.82	6.00	PASS
Middle	587	4.82	6.00	
High	695	4.82	6.00

3.2 Output Power and Power Spectral Density

3.2.1 Requirement

- FCC Part15 subpart H Section 15.709

EIRP (6 MHz)	Conducted power limit ¹ (6 MHz)	Conducted PSD limit (100 kHz)	Conducted adjacent channel emission limit (100 kHz)
16 dBm (40 mW)	10 dBm (10 mW)	-7.4 dBm	-62.8 dBm
20 dBm (100 mW)	14 dBm (25 mW)	-3.4 dBm	-58.8 dBm
24 dBm (250 mW)	18 dBm (63 mW)	0.6 dBm	-54.8 dBm
28 dBm (625 mW)	22 dBm (158 mW)	4.6 dBm	-50.8 dBm
32 dBm (1600 mW)	26 dBm (400 mW)	8.6 dBm	-46.8 dBm
36 dBm (4000 mW)	30 dBm (1000 mW)	12.6 dBm	-42.8 dBm
40 dBm (10000 mW)	30 dBm (1000 mW)	12.6 dBm	-42.8 dBm

¹The conducted power spectral density from a fixed white space device shall not be greater than the values shown in the table when measured in any 100 kHz band during any time interval of continuous transmission, except that a 40 mW fixed white space device operating in a four megahertz channel within a seven megahertz guard band must comply with a conducted power spectral density limit of -5.4 dBm.

3.2.2 Test Procedure

1. Connect a patch cable of known attenuation (at the specific frequencies under consideration) between the antenna port of the DUT and a spectrum analyzer. For a fixed White Space device, it may be necessary to insert an external attenuator in the signal path to prevent overload damage to the analyzer.
2. Select the analyzer's power averaging (RMS) detector, a span of 10-MHz, a resolution bandwidth (RBW) of 100-kHz, a video bandwidth of 300 kHz, and a sweep speed that provides one millisecond per trace point integration time.
3. Activate the DUT test mode that provides continuous transmission of the output signal (no time bursting or signal gating) on the operating channel under investigation, as required by §15.709(c). Low, middle, and high channels within tuning range must be examined.
4. Employ trace averaging over a minimum of 100 traces.
5. Use the integrated band/channel power analyzer function to determine the average power within the 6-MHz channel bandwidth.
6. Use the peak marker function to determine the maximum power spectral density (PSD) in any 100 kHz band segment.
7. Make the necessary corrections to the measured amplitude levels to account for externalities inserted into the signal path (e.g., signal attenuation in patch cable and/or external attenuator). Record the adjusted amplitude levels as the power levels measured for power and PSD in 6-MHz and 100-kHz band, respectively.
8. If the device has multiple antenna ports, power must be summed across all antennas and antenna elements (§15.709(c)(2)).
9. Compare the total conducted power levels and PSDs to the applicable conducted power and PSD limits to assess compliance. Add the necessary antenna gain of the DUT to determine EIRP levels.
10. Repeat until data is accumulated for the low, middle and high channels in the DUT tuning range.

3.2.3 Test environment

- 22 °C, 43 % R.H.

3.3 Band Edge and Adjacent Channel power

3.3.1 Requirement

- FCC Part15 subpart H Section 15.709 (d)

3.3.2 Test Procedure

Adjacent channel measurement:

1. Select the power averaging (RMS) detector, a start frequency of $f_L - 6$ MHz and a stop frequency of $f_L - 100$ kHz (where f_L is the lower edge frequency of the operating channel), a resolution bandwidth (RBW) of 100-kHz, a minimum video bandwidth of 300-kHz and a sweep speed that provides one millisecond per trace point integration time.
2. Employ trace averaging over a minimum of 10 traces.
3. Use the peak marker function of the analyzer to determine the maximum power spectral density in any 100-kHz segment within the frequency span.
4. Adjust the measured amplitude level to account for externalities in the signal path (e.g., attenuation in the patch cable for conducted measurements and the measurement antenna gain for radiated tests).
5. Repeat the procedure with the analyzer start frequency set to $f_U + 100$ kHz and the stop frequency set to $f_U + 6$ MHz.
6. Repeat the entire procedure until data is accumulated for the lower, middle and upper channels in the DUT tuning range.

Band edge measurement:

1. Select the power averaging (RMS) detector, a start frequency of $f_L - 100$ kHz and a stop frequency of f_L (where f_L is the lower edge frequency of the operating channel), a resolution bandwidth (RBW) of 10 kHz, a minimum video bandwidth of 30 kHz and a sweep speed that provides one millisecond per trace point integration time.
2. Employ trace averaging over a minimum of 100 traces.
3. Use the integrated band/channel power function of the analyzer to determine the maximum average power spectral density over the 100 kHz frequency span.
4. Adjust the measured amplitude level to account for externalities in the signal path (e.g., attenuation in the patch cable for conducted measurements) to include measurement antenna gain for radiated tests.
5. Repeat the procedure with the analyzer start frequency set to f_U and the stop frequency set to $f_U + 100$ kHz.
6. Repeat the entire procedure until data is accumulated for the lower, middle, and upper channels in the DUT tuning range.

3.4 Radiated Emission

3.4.1 Requirement

- FCC Part15 subpart H Section 15.709 (d)

3.4.2 Test Procedure

The radiated emissions measurements were performed on the 3 m anechoic chamber. The EUT was placed on a non-conductive turntable above the ground plane. The frequency spectrum from 30 kHz to 7.0 GHz was scanned and maximum emission levels at each frequency recorded. The system was rotated 360°, and the antenna was varied in the height between 1.0 m and 4.0 m in order to determine the maximum emission levels. This procedure was performed for horizontal and vertical polarization of the receiving antenna.

3.5 Conducted Emission Test

3.5.1 Requirement

- FCC Part15 subpart C Section 15.207

3.5.2 Test Procedure

The EUT was placed on a wooden table, 0.8 m height above the floor. Power was fed to the EUT through a 50 Ω / 50 μ H + 5 Ω Artificial Mains Network (AMN). The ground plane was electrically bonded to the reference ground system and all power lines were filtered from ambient.

3.6.3 Test data

- Resolution bandwidth : 9 kHz
- Frequency range : 0.15 MHz ~ 30 MHz
- Tested Line : HOT LINE

-. Tested Line : NEUTRAL LINE

3.6 Antenna Requirement

3.6.1 Requirement

- FCC Part15 subpart H Section 15.203
- An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with §15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

3.6.2 Result

- Must the EUT be professionally installed? ☒ YES ☐ NO
- Does the EUT have detachable antenna(s)? ☒ YES ☐ NO
- If detachable, is the antenna connector(s) non-standard? ☐ YES ☒ NO ☐ N/A
