Caution

Any changes or modifications (including the antenna) made to this device that are not expressly approved by the manufacturer may void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

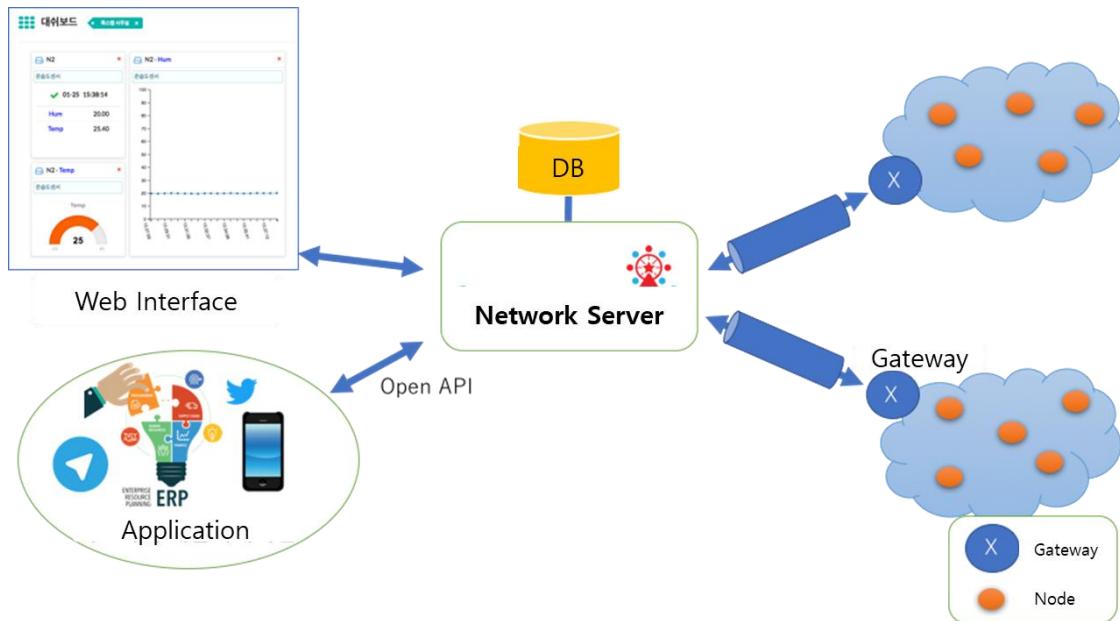

- (1) This device may not cause harmful interference. and
- (2) This device must accept any interference received, including interference that may cause undesired operation.

To comply with FCC RF exposure compliance requirements, a separation distance of at least 20 cm must be maintained between the antenna of this device and all persons. This device must not be co-located or operation in conjunction with any other antenna or transmitter.

This equipment complies with FCC

1. Introduction

IoT refers to the connection of wireless and wired-based sensing systems to the Internet and the web. Through this, the value of sensing data is maximized by facilitating the use of sensing data.

LoRa Gateway is located between the Node and the Network Server system and converts the sensing data provided by the Node into a Network Server compatible format and transmits the commands sent from the Network Server to the Node. Usually, a Linux router with wired (Ethernet) and wireless (Bluetooth, LoRa, ZigBee, etc.) communication interfaces based on processors such as ARM Cortex-A series and MIPS.

PLG400 is a LoRaWAN gateway that can be installed outdoors. LoRaWAN is a low power wide area (LPWA) wireless network technology widely used in the Internet of Things, and the PLG400 connects various installed LoRa sensors to the Internet.

2. Hardware Specification

The hardware specifications of the PLG400 are as follows

Category		Description
H/W	CPU	800MHz Sitara™ ARM® Cortex®-A8 32-Bit RISC Processor (AM3352ZCZA80)
	SDRAM	512MB DDR3L SDRAM
	Flash	4GB NAND Flash with MMC controller
	Power Supply	DC 48V PoE, 24W
	Dimension	226 x 183 x 65 (W x H x D, mm)
	Weight	1.7Kg
	RF	LoRa
	I/O	SX1301
		Ethernet
		10/100/1000 B-TX 1 Port With POE
	Console	Micro USB
	USB	2.0 Full-Speed x2 (USB A Type)
S/W	OS	Linux kernel 4.14.79 (32bit)

Description of each part of PLG400 is as follows.

- **Front**

- ① **LoRa**: LoRa Antenna connection Port
- ② **GPS**: GPS Antenna connection Port

- **Rear**

- ① **PoE 48V** : Power & WAN connection Port
- ② Pressure valve

3. Components

Category	Quantity
PLG400 Gateway	1
LoRa Antenna	1
GPS Antenna	1
PoE Injector	1

4. Quick Start

The PLG400 is set up to connect to the WAN using DHCP. Therefore, a PoE injector can be used to connect a LAN for the Internet connection to the WAN and connect the power. When the power is connected, the PWR, WAN inside the device turn on.

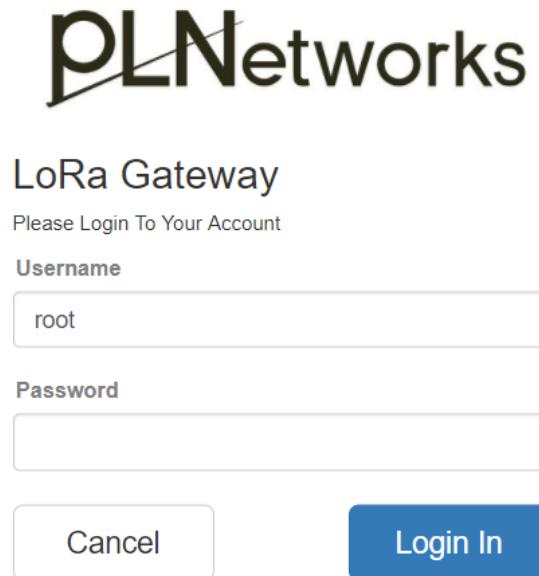

5. Preferences

5.1 Connection & Login

To change various settings of the PLG400, you need to access the built-in web interface.

- Access the assigned IP through the WAN port of the gateway. If you are using a static IP or know the IP address assigned through a DHCP server, you can use that IP address to connect.
- Enter port 8080 after the IP address to connect. Ex) http:// [IP address]: 8080

When connected, the login screen will appear as shown below.

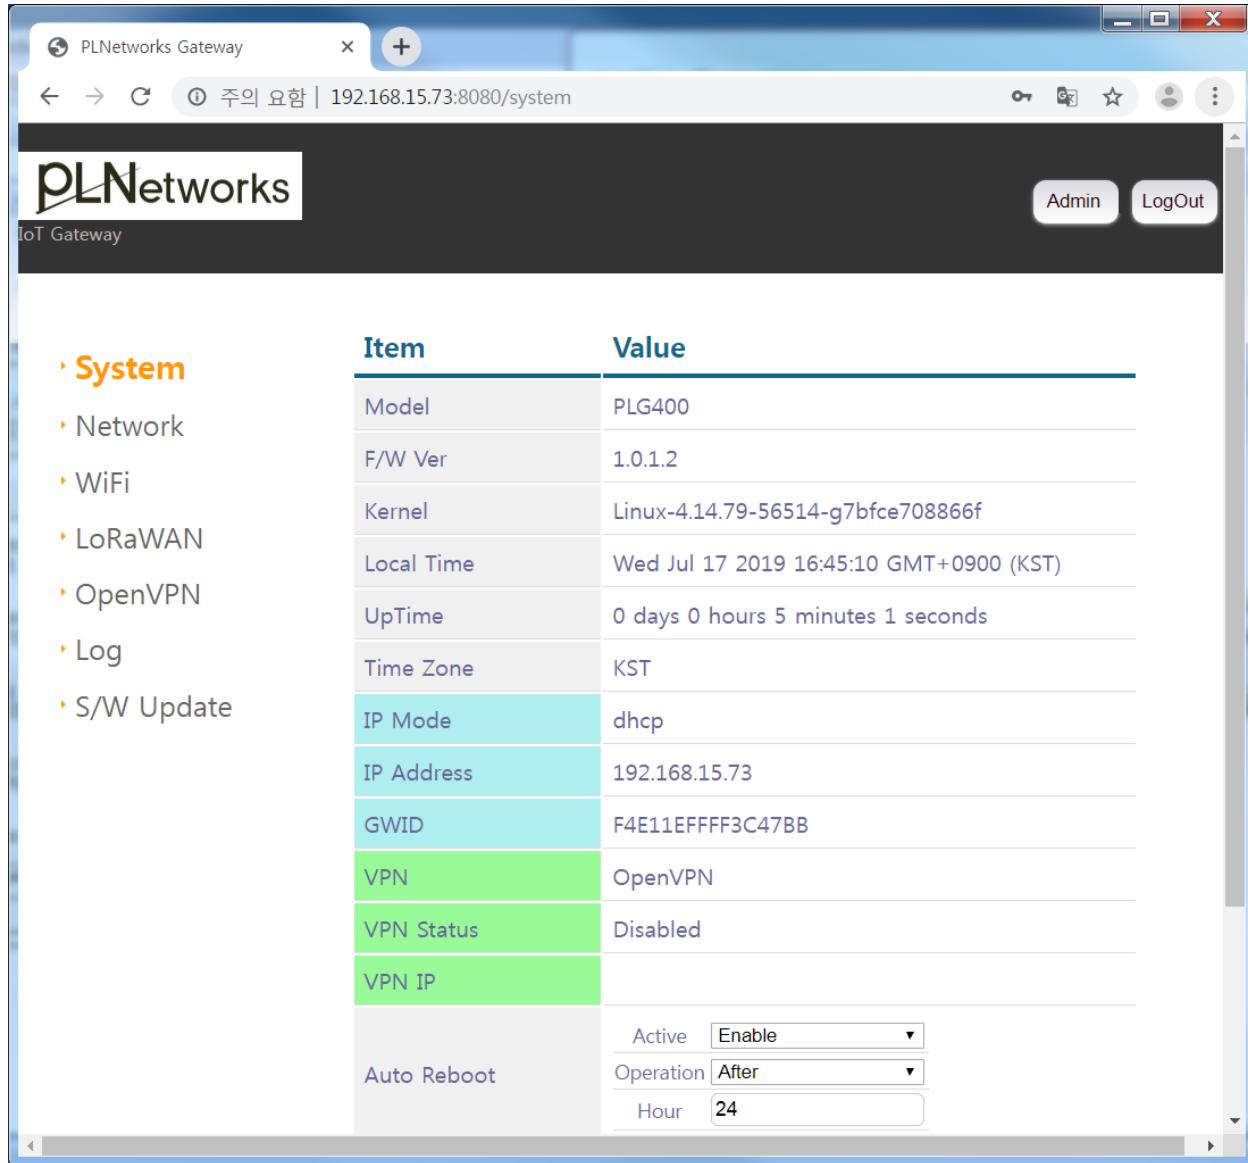

The image shows the LoRa Gateway login interface. At the top, the PLNetworks logo is displayed. Below it, the text "LoRa Gateway" is centered. A sub-instruction "Please Login To Your Account" is present. The form includes a "Username" field containing "root" and a "Password" field (which is empty). At the bottom, there are two buttons: "Cancel" on the left and a blue "Login In" button on the right.

ID and Password to input are as follows.

ID	root
Password	admin

After logging in, the PLG400 system screen appears.

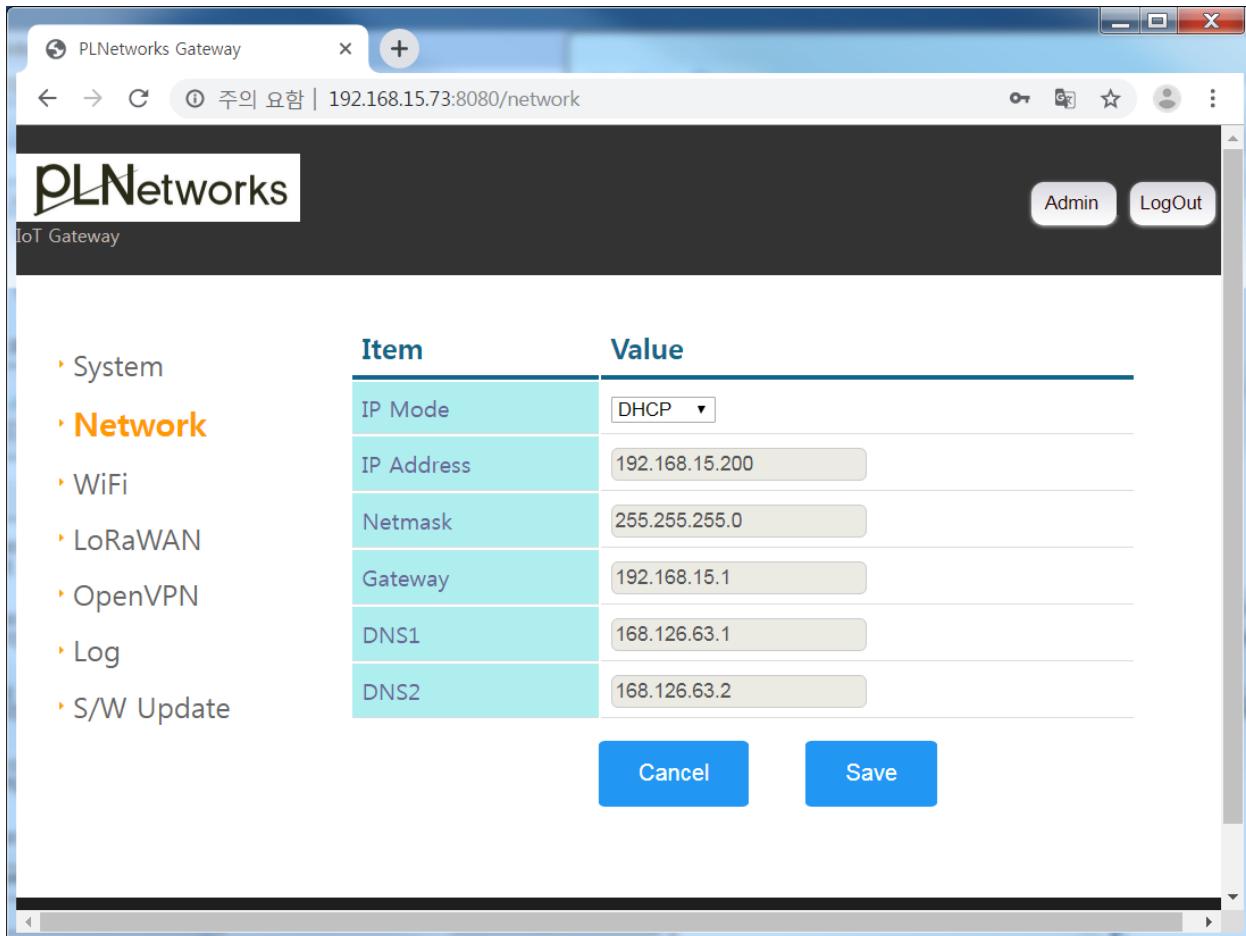

The screenshot shows a web-based configuration interface for the PLG400. The top navigation bar includes a logo, the text 'PLNetworks Gateway', and a URL '192.168.15.73:8080/system'. The top right corner features 'Admin' and 'LogOut' buttons. The main content area has a sidebar on the left with a 'System' section containing links for Network, WiFi, LoRaWAN, OpenVPN, Log, and S/W Update. The main panel displays a table of system parameters with their values. The table has two columns: 'Item' and 'Value'. The 'Item' column includes Model, F/W Ver, Kernel, Local Time, UpTime, Time Zone, IP Mode, IP Address, GWID, VPN, VPN Status, and VPN IP. The 'Value' column provides the corresponding details. At the bottom of the table, there are dropdown menus for 'Active' (set to 'Enable'), 'Operation' (set to 'After'), and 'Hour' (set to '24').

Item	Value
Model	PLG400
F/W Ver	1.0.1.2
Kernel	Linux-4.14.79-56514-g7bfce708866f
Local Time	Wed Jul 17 2019 16:45:10 GMT+0900 (KST)
UpTime	0 days 0 hours 5 minutes 1 seconds
Time Zone	KST
IP Mode	dhcp
IP Address	192.168.15.73
GWID	F4E11EFFFF3C47BB
VPN	OpenVPN
VPN Status	Disabled
VPN IP	
Auto Reboot	 Active: Enable Operation: After Hour: 24

Shows the model and network, firmware and kernel versions currently reflected in the PLG400.

5.2 Networks

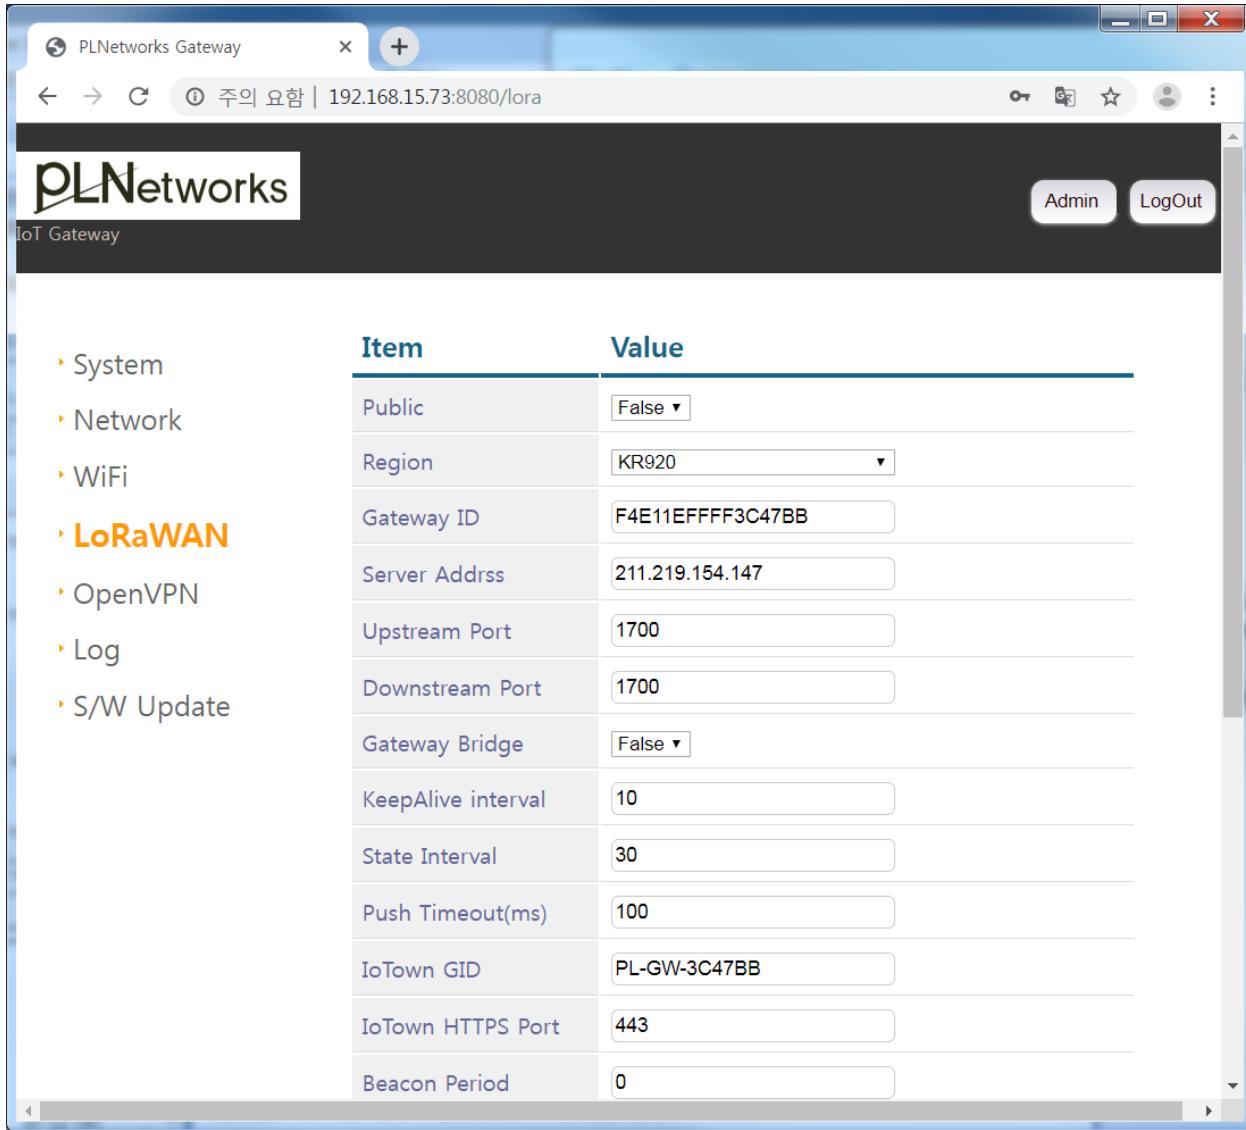

The displayed parameters represent the values currently set in the PLG400.

Set the IP address that the PLG400 will use to connect to the WAN.

- Static / DHCP: Set whether to use static or dynamic IP.
- Local IP: If you are using a static IP, enter the IP address to use.
- Netmask: Enter the subnet mask if using static IP.
- Gateway: If using a static IP, enter the gateway IP address to use.

Click on the 'Save' button at the bottom to save the settings.

5.3 LoRaWAN

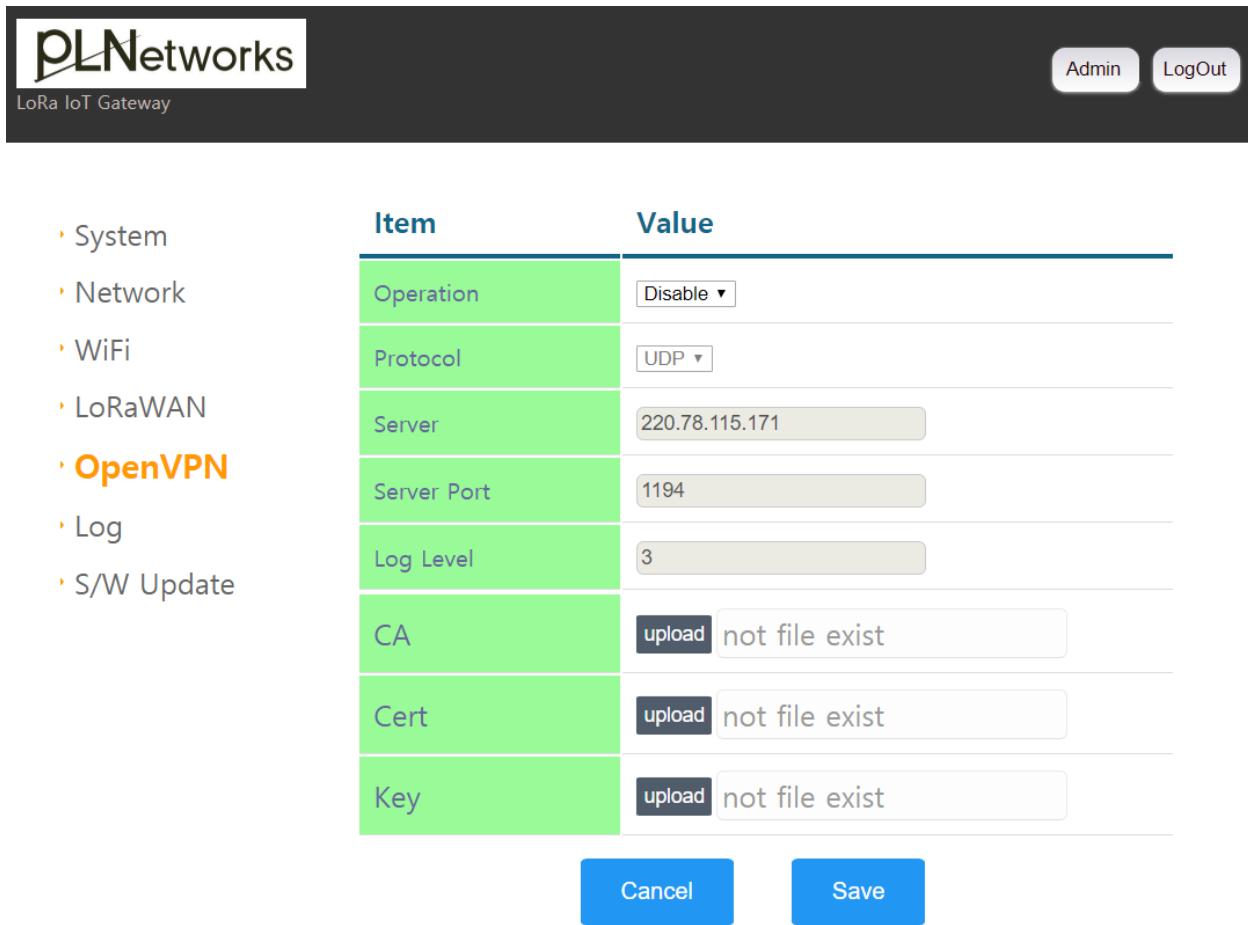

Item	Value
Public	<input type="button" value="False ▾"/>
Region	<input type="button" value="KR920 ▾"/>
Gateway ID	<input type="text" value="F4E11EFFFF3C47BB"/>
Server Address	<input type="text" value="211.219.154.147"/>
Upstream Port	<input type="text" value="1700"/>
Downstream Port	<input type="text" value="1700"/>
Gateway Bridge	<input type="button" value="False ▾"/>
KeepAlive interval	<input type="text" value="10"/>
State Interval	<input type="text" value="30"/>
Push Timeout(ms)	<input type="text" value="100"/>
IoTown GID	<input type="text" value="PL-GW-3C47BB"/>
IoTown HTTPS Port	<input type="text" value="443"/>
Beacon Period	<input type="text" value="0"/>

LoRaWAN parameter value can be set.

- You can adjust KeepAlive interval of IP, Port and Gateway of Network Server.
- IoTown GID can get the basic information (Boot Time, Recent Act., Etc.) of the Gateway by using the same name when registering the Gateway in the Network Server..

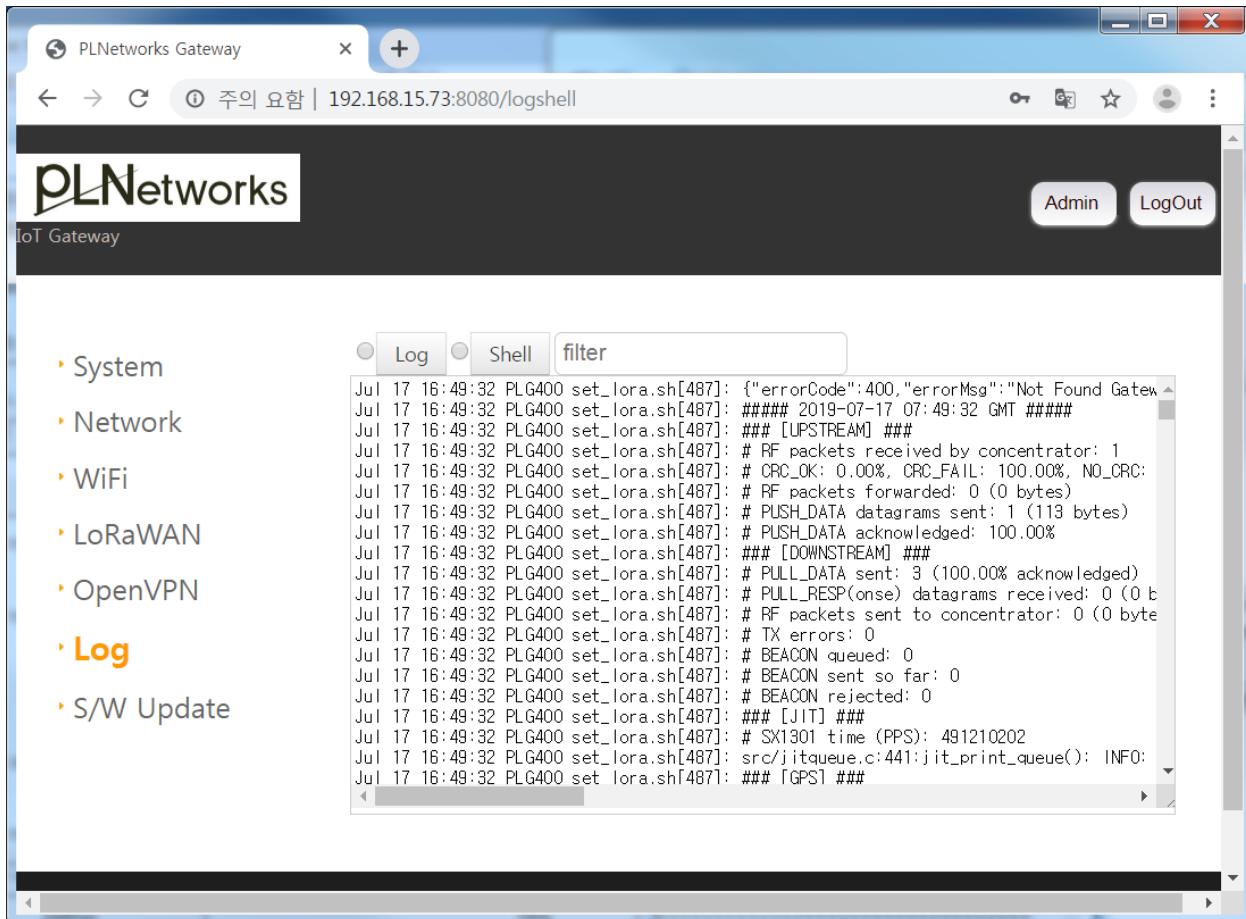

5.4 OpenVPN

Item	Value
Operation	Disable ▾
Protocol	UDP ▾
Server	220.78.115.171
Server Port	1194
Log Level	3
CA	<input type="button" value="upload"/> not file exist
Cert	<input type="button" value="upload"/> not file exist
Key	<input type="button" value="upload"/> not file exist

You can configure the settings for using OpenVPN (Protocol, VPN Server IP, etc.).

5.5 Log

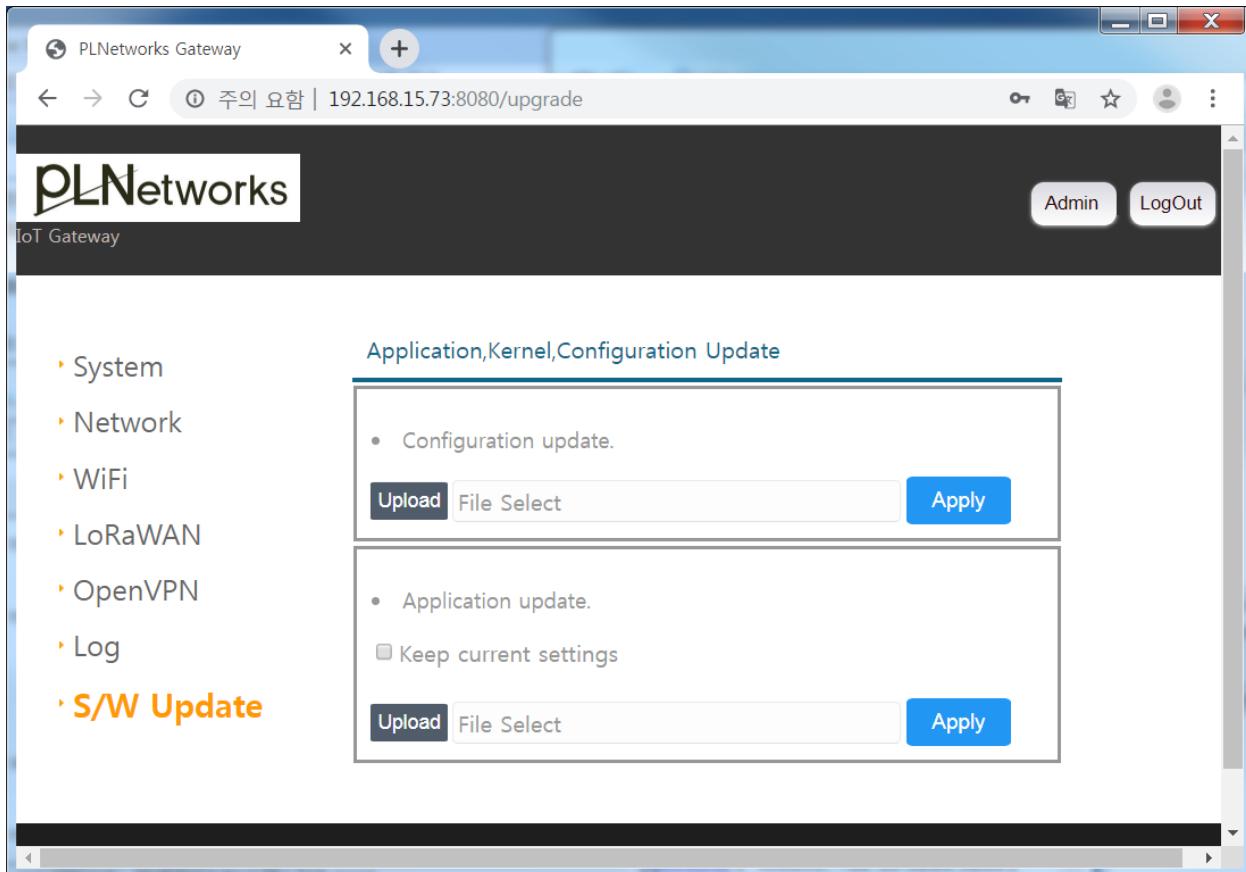

It shows the status window and log related to the linkage between PLG400 and LRR (server).

If you press 'Shell' button, you can search the status by typing Shell command at the bottom.

Four Commands can be entered.

- ps
- cat
- ls -al
- systemctl stop [process name]

5.6 Software Update

You can update configuration files, applications, and kernel files.

To update the file, press File Select to select the file, click Upload to upload the file, and then click the 'Apply' button. Reboot proceeds after applying and takes 2 ~ 30 seconds.

6. Gateway installation environment and examples

- Gateway installation environment

- ✓ Erect and install a separate pole on the roof of a building or on a high terrain to accommodate multiple node sensors.
- ✓ Install directly using a bracket on the pole or install it in a separate dedicated enclosure.

- Gateway installation examples

7. Troubleshooting

- The PWR LED does not light up.
 - Make sure the 48V PoE adapter provided with the gateway is physically connected
 - After removing the adapter, apply power again after a full discharge (approximately 20 to 30 seconds).
- LoRa LED does not light up.
 - Check that the gateway is registered in the network server as a compatible device.
 - After pressing the reset switch, check if it operates normally.
- The WAN LED does not light up.
 - LAN Check if the LAN cable is properly connected to the WAN port.
 - Check that the gateway is registered in the network server as a compatible device.
