For frequencies below 100 MHz, the following may be considered for SAR test exclusion (also illustrated in AppendixC)

- 1)For test separation distances >50 mm and <200 mm the power threshold at the corresponding test separation distance at 100 MHz in step b) is multiplied by $[1+\lg(100/f\text{MHz})]$
- 2)For test separation distances ≤ 50 mm, the power threshold determined by the equation in c)1) for 50 mm and 100 MHz is multiplied by $\frac{1}{2}$
- 3) SAR measurement procedures are not established below 100 MHz

Appendix C

SAR Test Exclusion Thresholds for < 100 MHz and < 200 mm

Approximate SAR test exclusion power thresholds at selected frequencies and test separation distances are illustrated in the following table. The equation and threshold in 4.3.1 must be applied to determine SAR test exclusion.

| MHz | <50 | 50 | 60 | 70 | 80 | 90 | 100 | 110 | 120 | 130 | 140 | 150 | 160 | 170 | 180 | 190 | mm |

Power and distance are rounded to the nearest mW and mm before calculation
The result is rounded to one decimal place for comparison

13.56Mhz:

$$d=3\text{m} \quad \text{EIRP (dBm)} = E(\text{dBuV/m}) - 95.3 \text{mW} = 10[\text{dBm}/10]$$

$$pt = 91.38 \text{ dBuV/m} = -3.85 \text{ dBm} = 0.4121 \text{ mW} < 154 \text{ mW}$$

Then SAR evaluation is not required
