5.1.1 Requirement

§1.1310: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in §1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of FCC part 2.1093 of this chapter.

Table 1 to §1.1310(e)(1) - Limits for Maximum Permissible Exposure (MPE)

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
(i) Limits for Occupational/Controlled Exposure				
0.3-3.0	614	1.63	*(100)	≤6
3.0-30	1842/f	4.89/f	*(900/f ²)	<6
30-300	61.4	0.163	1.0	<6
300-1500			f/300	<6
1500-100000			5	<6
(ii) Limits for General Population/Uncontrolled Exposure				
0.3-1.34	614	1.63	*(100)	<30
1.34-30	824/f	2.19/f	*(180/f ²)	<30
30-300	27.5	0.073	0.2	<30
300-1500			f/1500	<30
1500-100000			1.0	<30

f = frequency in MHz

* = Plane-wave equivalent power density

Note 1: Occupational/controlled exposure limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure.

Note 2: General population/uncontrolled exposure limits apply in situations in which the general public may be exposed, or in which persons who are exposed as a consequence of their employment may not be fully aware of the potential for exposure or cannot exercise control over their exposure.

5.2 Test setup

5.3 Test Procedures

- a. The RF exposure test was performed in anechoic chamber.
- b. For very long or tall devices, when measuring the middle or end coil configurations, some surfaces or edges may be very far away from the transmitting coil. For those far away edges or surfaces, measure with the center of the probe 20 cm away from the edge of the transmitting coil, respectively. If the edge or surface is greater than 20 cm away from the edge of the transmitting coil, respectively, measure with the probe touching that edge or surface.
- c. The highest emission level was recorded and compared with the limit.
- d. The EUT was measured according to the dictates of KDB 680106 D01 Wireless Power Transfer v04 and RF Exposure Procedures TCBC workshop October 2020.
- e. The measurement methodology is as follows: Fully load the host with identical clients, one per each coil. Measure H-Field at 20 cm from the edges and from the top surface; the bottom does not face the user, so no need to measure the bottom. Place the client on coil 1 closest to the end of the device and measure the H-field at 20 cm from the edge and upper surface of the device. Coil 4 repeats the measurement method of coil 1. Place the client on coil 3 at the other end of the device and measure the H-field 20 cm away from the edge and upper surface of the device. Coil 6 repeats the measurement method of coil 3. Place a client on coil 2 near the middle of the device and measure the H-field 20 cm from the edge and upper surface. Repeat the measurement method for coil 2; coil 5 repeats the measurement method for coil 2.

5.4 Equipment Approval Considerations

Requirement	Device
1. The power transfer frequency is below 1 MHz.	Yes. The operating frequencies are: 123.8KHz-146.7KHz
2. The output power from each transmitting element (e.g., coil) is less than or equal to 15 watts.	Yes. The maximum output power is: 7.5W
3. A client device providing the maximum permitted load is placed in physical contact with the transmitter (i.e., the surfaces of the transmitter and client device enclosures need to be in physical contact)	No. The client device isn't placed directly in contact with the transmitter. the transmitter coil to receiver coil separation is between 10mm and 17mm, however, the client is sealed in a box and the box is in contact with the charging cabinet surface.
4. Only § 2.1091-Mobile exposure conditions apply (i.e., this provision does not cover § 2.1093-Portable exposure conditions).	Yes. Mobile exposure conditions only.
5. The E-field and H-field strengths, at and beyond 20 cm surrounding the device surface, are demonstrated to be less than 50% of the applicable MPE limit, per KDB 447498, Table 1. These measurements shall be taken along the principal axes of the device, with one axis oriented along the direction of the estimated maximum field strength, and for three points per axis or until a 1/d (inverse distance from the emitter structure) field strength decay is observed. Symmetry considerations may be used for test reduction purposes. The device shall be operated in documented worst-case compliance scenarios (i.e., the ones that lead to the maximum field components), and while all the radiating structures (e.g., coils or antennas) that by design can simultaneously transmit are energized at their nominal maximum power.	Yes. See the test result in item 5.5.
6. For systems with more than one radiating structure, the conditions specified in (5) must be met when the system is fully loaded (i.e., clients absorbing maximum power available), and with all the radiating structures operating at maximum power at the same time, as per design conditions. If the design allows one or more radiating structures to be powered at a higher level while other radiating structures are not powered, then those cases must be tested as well. For instance, a device may use three RF coils powered at 5 W, or one coil powered at 15 W: in this case, both scenarios shall be tested.	Yes. The EUT has six radiating structure and all scenarios have been tested.
