# Overview

The Quectel YFBP001WWB is a compact form factor SMT mount PCB chip antenna for Wi-Fi applications. Due to the dimensions of  $5.0 \times 3.6 \times 0.5$  mm, it is designed for very small space requirements for smart metering, remote monitoring, vehicle tracking and telematics, and many other IoT devices. The YFBP001WWB is a ground-dependent IFA antenna, uses main PCB as its ground plane. It is delivered on tape and reel.

The YFBP001WWB is a PCB chip antenna, which can be mounted on super compact space require terminals. Despite of this small factor, it has up to 81.1 % efficiency in working bands. This antenna is developed on an  $80 \times 40$  mm evaluation board. If the devices have different ground sizes, matching circuit can be used to tune the resonant frequency correctly. We also offer gerber file, 2D & 3D documents for PCB layout.

The YFBP001WWB allows high efficiency, stable signal transmission and reception for Wi-Fi working bands in 2400–2500 MHz. This product is RoHS compliant.

Typical applications include:

- Asset Tracking
- Smart Metering
- Fleet Management
- IoT Sensors and Modules

## 4 Schematic Symbol and Pin Definition

- The pin assignment for the antenna is as follows.
- The antenna has 6 pins and only three work.
- All other pins are designed for mechanical strength.

Pin No.	Description
1, 6	Antenna Tuning
2, 3, 4	Not used (Mechanical only)
5	FEED

## 5 Transmission Line

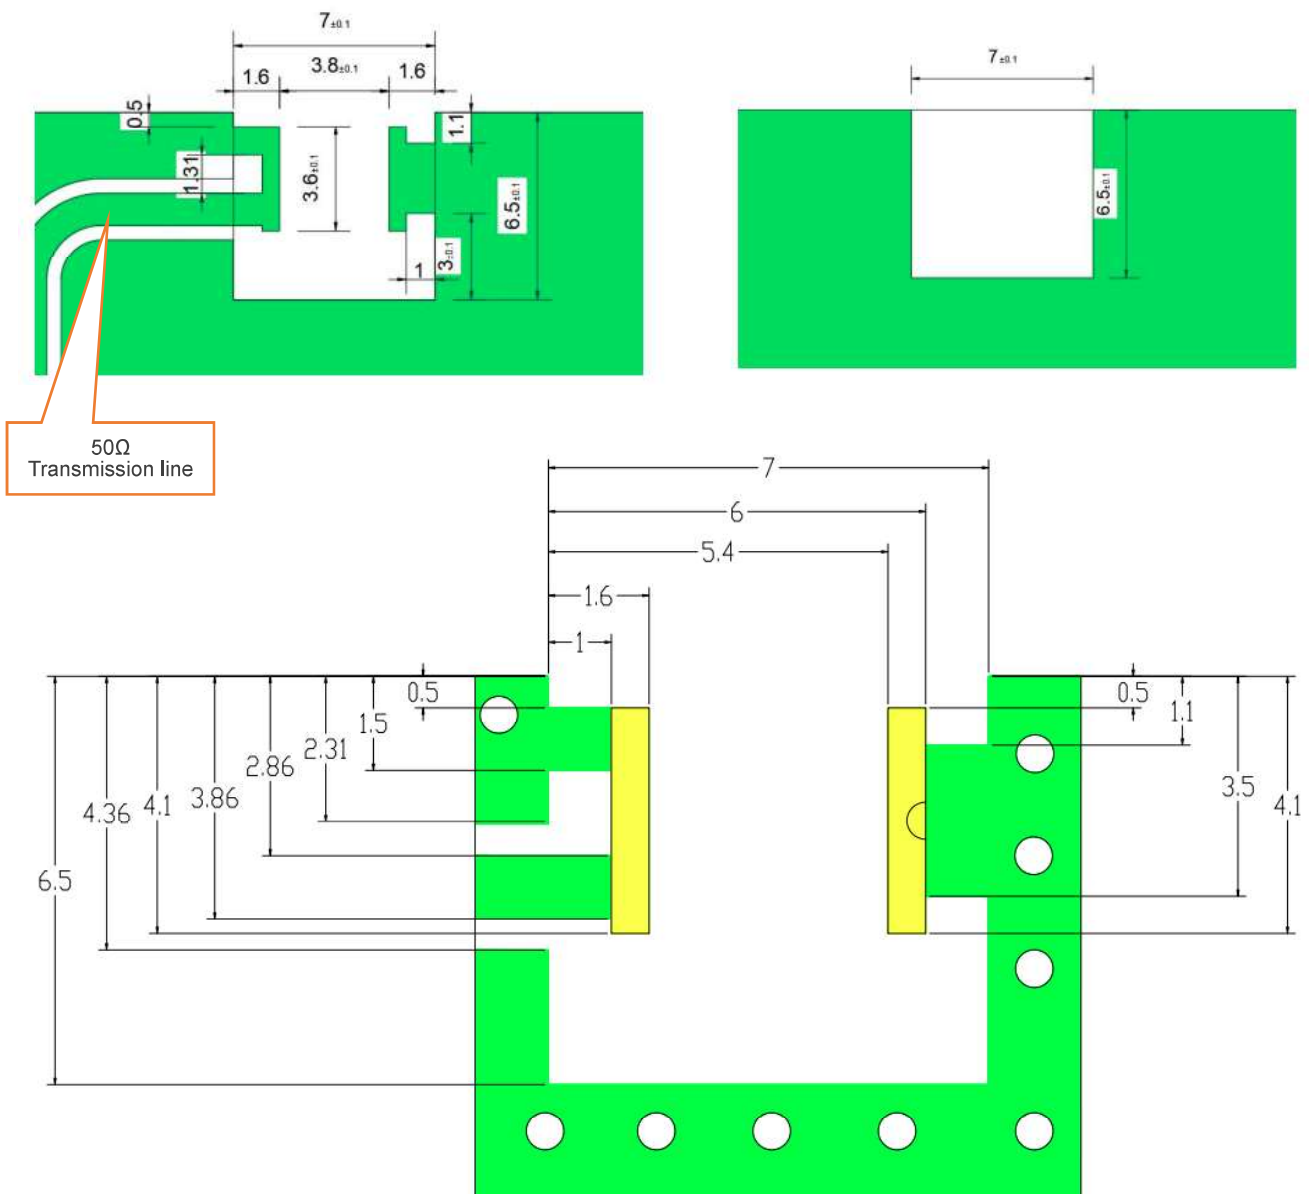

The characteristic impedance of all transmission lines shall be designed as 50  $\Omega$ .

- The length of the transmission lines should be kept as short as possible.
- Any other part of the RF system, such as transceiver, power amplifiers, etc., shall also be designed with an impedance of 50  $\Omega$ .

Once the material for the PCB has been chosen (PCB thickness and dielectric constant), a coplanar transmission line can easily be designed using any of the commercial software packages for transmission line design. For the chosen PCB thickness, copper thickness and substrate dielectric constant, the program will calculate the appropriate transmission line width and gaps on either side of the track so the characteristic impedance of the coplanar transmission is 50  $\Omega$ .

## 6 Recommended PCB Layout

The host PCB must be designed using the PCB footprint shown with the correct clearances. An example of the PCB layout shows the antenna footprint. Please note this clearance area is critical to the performance of the antenna and must be applied through all layers of the PCB.
