
Si522A**13.56MHz reader/writer for contactless communication****1. Introduction**

Si522A is a highly integrated NFC front-end for contactless communication at 13.56 MHz, and supports automatic carrier detection function (ACD). Reader/Writer mode supporting ISO/IEC 14443A.

The Si522A's internal transmitter part is able to drive a reader/writer antenna designed to communicate with ISO/IEC 14443A cards and transponders without additional active circuitry. The receiver part provides a robust and efficient implementation of a demodulation and decoding circuitry for signals from ISO/IEC 14443A compatible cards and transponders. The digital part handles the complete ISO/IEC 14443A framing and error detection (Parity and CRC).

In ACD mode, the chip is mostly in sleep mode and woken up by 3K RC at a fixed time. It detects a 13.56MHz RF field and RF card with extremely low power consumption, and automatically generates interrupts to wake up the MCU when the field or card is detected. The functions of the detection field and card can be enabled separately. Under a typical 500ms polling cycle, the current is approximately 3.4uA. The entire ACD process does not require MCU intervention.

Various host controller interfaces are implemented:

- SPI interface
- Serial UART (similar to RS232 with voltage levels according pad voltage supply)
- I2C interface.

2. Feature and benefits

- Highly integrated analog circuitry to demodulate and decode responses
- Buffered output drivers for connecting an antenna with the minimum number of external components
- Typical operating distance in Read/Write mode up to 50 mm depending on the antenna size and tuning
- Supports ISO/IEC 14443 A with higher transmission rates communication, up to 848 kBd
- Supported host interfaces:
 - SPI up to 10 Mbit/s
 - I2C interface up to 400 kBd in fast mode, up to 3400 kBd in high-speed mode
 - Serial UART up to 1228.8 kBd
- FIFO buffer handles 64 byte send and receive
- Flexible interrupt modes
- Hard reset with low power
- Power-down by software
- Programmable timer
- Internal oscillator for connection to 27.12 MHz quartz crystal
- 2.5 V to 3.6 V power supply
- CRC coprocessor
- Programmable I/O pins
- Support ACD mode
 - ACD mode supports for automatic detection of RF and cards
 - ACD process without MCU intervention
 - OSC vibration failure monitoring

3. Quick reference data

Voltage、current and temperature in various modes

Table 3-1 Quick reference data

Parameter	Symbol	Condition	NOTE	Min	Typ	Max	Unit
Analog supply voltage	VDDA	AVDD=PVDD=SVDD=TVDD;	(1)	2.3	3.3	4	V
TVDD supply voltage	VDD(TVDD)	VSSA=VSSD=VSS(PVSS)=VSS(TVSS)=0V		2.3	3.3	4	V
PVDD supply voltage	VDD(PVDD)		(1)	2.3	3.3	4	V
SVDD supply voltage	VDD(SVDD)	VSSA=VSSD=VSS(PVSS)=VSS(TVSS)=0V		2.3	3.3	4	V
Power-down current	I _{pd}	AVDD=VDD(SVDD)=VDD(TVDD)=VDD(PVDD)=3.3V					
		hard power-down; pin NRSTPD set LOW	(2)	-	1.1	1.5	uA
		soft power-down; RF level detector on	(2)	-	1.1	1.5	uA
Auto card search average current	IACD1	500ms auto card search interval		-	3.5	4	uA
Auto field search average current	IACD2	500ms auto field search interval		-	2.8	3.5	uA
PVDD supply current	IDDD	pin PVDD; PVDD=3.3V		-	0.9	1.5	mA
Analog supply current	IDDA	pin AVDD; VDDA = 3V, CommandReg register's RcvOff bit = 0		-	3	4	mA
		pin AVDD; receiver switched off; VDDA = 3V, CommandReg register's RcvOff bit = 1		-	0.9	1	mA
TVDD supply current	IDD(TVDD)	continuous wave	(3)	-	20	30	mA
Storage temperature		QFN32		-55	-	+125	°C
Operating temperature		QFN32		-40	-	+85	°C

NOTE: (1) VDDA, VDDD and VDD(TVDD) must always be the same voltage. VDD(PVDD) must equal or smaller than VDDD.

(2) I_{pd} is the total current for all supplies.

(3) During typical circuit operation, the overall current is below 30 mA.

NOTE: Stresses beyond those Absolute Maximum Ratings may cause permanent damage to the device.

4. Block diagram

The analog interface handles the modulation and demodulation of the analog signals.

The contactless UART manages the protocol requirements for the communication protocols in cooperation with the host. The FIFO buffer ensures fast and convenient data transfer to and from the host and the contactless UART .

Various host interfaces are implemented to meet different customer requirements.

Figure 4-1 Simplified block diagram of the Si522A

5. Pinning information

Figure 5.1 Pinning configuration

Table 5-1 Pinning description

Pin	Symbol	Type[1]	Description
1	SDI	I	I2C bus input[2]
2	PVDD	P	Pad power supply
3	DVDD	P	Digital Power Supply
4	DVSS	P	Digital Ground
5	PVSS	P	Pad power supply ground
6	NRSTPD	I	Not Reset and Power Down: When LOW, internal current sinks are switched off, the oscillator is inhibited, and the input pads are disconnected from the outside world. With a positive edge on this pin the internal reset phase starts.
7	MFIN	I	Communication Interface Input: accepts a digital, serial data stream
8	MFOUT	O	Communication Interface Output: delivers a serial data stream
9	SVDD	P	Provides power to the MFIN/MFOUT
10	TVSS	P	Transmitter Ground: supplies the output stage of TX1 and TX2

11	TX1	O	Transmitter 1: delivers the modulated 13.56 MHz energy carrier
12	TVDD	P	Transmitter Power Supply: supplies the output stage of TX1 and TX2
13	TX2	O	Transmitter 2: delivers the modulated 13.56 MHz energy carrier
14	TVSS	P	Transmitter Ground: supplies the output stage of TX1 and TX2
15	AVDD	P	Analog Power Supply
16	VMID	P	Internal Reference Voltage: This pin delivers the internal reference voltage.
17	RX	I	Receiver Input
18	AVSS	P	Analog Ground
19	AUX1	O	Auxiliary Outputs: These pins are used for testing.
20	AUX2	O	
21	OSCIN	I	Crystal Oscillator Input: input to the inverting amplifier of the oscillator. This pin is also the input for an externally generated clock (fosc = 27.12 MHz).
22	OSCOU	O	Crystal Oscillator Output: Output of the inverting amplifier of the oscillator.
23	IRQ	O	Interrupt Request: output to signal an interrupt event
24	SDA	I/O	I2C bus serial data input and output[2]
	NSS	I	SPI input[2]
	RX	I	UART Address input[2]
25	D1	I/O	Test port[2]
	ADR_5	I/O	I2C bus address5 input[2]
26	D2	I/O	Test port
	ADR_4	I	I2C bus address4 input[2]
27	D3	I/O	Test port
	ADR_3	I	I2C bus address3 input[2]
28	D4	I/O	Test port
	ADR_2	I	I2C bus address2 input[2]
29	D5	I/O	Test port
	ADR_1	I	I2C bus address1 input[2]
	SCK	I	SPI serial clock input I[2]
	DTRQ	O	UART makes a request to controller[2]
30	D6	I/O	Test port
	ADR_0	I	I2C bus address0 input[2]
	MOSI	I/O	SPI Master Out Slave In[2]

	MX	O	UART for the output of the controller[2]
31	D7	I/O	Test port
	SCL	I/O	I2C bus clock input/output[2]
	MISO	I/O	SPI Master In Slave Out[2]
	TX	O	UART Data output to controller[2]
32	EA	I	External address input: can be used to define the I2C address

NOTE: [1] Pin types: I = Input, O = Output, P = Power;

[2] The functions of these pins have another specifications in Chapter 8 Digital interface

6. Functional description

The Si522A transmission module supports the Read/Write mode for ISO/IEC 14443 A using various transfer speeds and modulation protocols.

NOTE: All indicated modulation indices and modes in this chapter are system parameters. This means beside the IC settings, a suitable antenna tuning is required to achieve the optimum performance.

Figure 6.1 Si522A Read/Write mode

6.1 ISO 14443A functionality

The physical level communication is shown below.

Figure 6.2 ISO/IEC 14443A Read/Write mode communication diagram

The physical parameters are described in Table 6-1.

Table 6-1 Communication overview for ISO/IEC 14443 A reader/writer

Communication direction	Signal type	Transfer speed			
		106kBd	212kBd	424kBd	848kBd
Reader to card (send data from the Si522A to a card)	reader side modulation	100%ASK	100%ASK	100%ASK	100%ASK
	bit encoding	modified Miller encoding	modified Miller encoding	modified Miller encoding	modified Miller encoding
	bit length	(128/13.56) μ s	(64/13.56) μ s	(32/13.56) μ s	(16/13.56) μ s

Card reader (Si522A receives data from a card))	card side modulation	subcarrier load modulation	subcarrier load modulation	subcarrier load modulation	subcarrier load modulation
	subcarrier frequency	13.56MHz/16	13.56MHz/16	13.56MHz/16	13.56MHz/16
	bit encoding	Manchester	BPSK	BPSK	BPSK

The Si522A's contactless UART and dedicated external host must manage the complete ISO/IEC 14443 A protocol. The internal CRC coprocessor calculates the CRC value based on ISO/IEC 14443 A-3 and handles parity generation internally based on the transmission rates.

Figure 6.3 Data coding and framing according to ISO/IEC 14443 A

6.2 Auto Low Power Polling Loop

Auto Low Power Polling Loop consists of 3 parts: listen、polling and sleep, where listen and sleep can be enabled separately, can achieve extremely low power consumption automatic field and card inspection. Under a 500ms polling cycle, its average current is only 3.4uA, which can automatically detect 13.56MHz RF field and RF card at lowest power consumption.

The schematic diagram is as follows:

Figure 6.4 ACD function diagram

The implementation principle of polling and listening functions can be found in the description of the detection circuit, T_CON during the polling and listening stages can be configured separately.

Figure 6.5 schematic diagram of the polling process

1) Listening stage

Si522A is searching for readers at this stage. Si522A does not transmit carriers and detects if there are 13.56MHz carriers transmitted by other external readers. If its amplitude is greater than RFExTreshold, stop executing Loop and generate an interrupt.

2) Polling stage

Si522A is searching for RF cards at this stage. Si522A first transmits the carrier and then detects the amplitude change of the 13.56MHz carrier. If the amplitude change of the carrier exceeds the set threshold, it is determined as stuck and an interrupt is generated.

a) Card checking mode: can be set to automatic mode and absolute value mode

- Automatic mode - Compare the carrier amplitude detected this time with the carrier amplitude detected last time, and if the difference exceeds the set threshold, it will be determined that there is a card.
- Absolute value mode - Compare the detected carrier amplitude with the set

value, and if the difference exceeds the set threshold, it is determined that there is a card.

b) Card checking direction: The card checking direction can be set to three modes as needed:

- Rising edge: carrier amplitude with card is greater than that without card
- Falling edge: carrier amplitude with card is smaller than that without card
- Double edge - carrier amplitude with card is greater or smaller than that without card
- Field anomaly judgment

3) Sleep stage: The chip is in a sleep state.

Related registers: 0x01, 0x0F_A/B/C/D/E/F/G/I/J/K/L/M/N/O/P

6.2.1 RF reference value automatic acquisition method

Automatically obtain through commands:

- By writing ADC_EXCUTE command to obtain, command code is 0110b
- Waiting for more than 100us
- Writing ADC_EXCUTE again, read 0X0F_G is the required reference value

6.2.2 Detection circuit

The principle of the detection circuit is as follows:

Figure 6.6 Detection circuit diagram

VRX: antenna field strength;

VRef: ADC reference voltage, measured by T_CON control;

VA: The voltage sent by the detection module to the ADC.

6.2.3 Oscillator monitoring

During the polling process, when the crystal oscillator fails to start up for 4 consecutive times, a crystal oscillator failure interrupt is generated. After an interrupt occurs, the chip does not wake up, but continues to execute Polling Loop. Once the OSC vibrates, the internal counter will reset.

The relevant registers: 0x0F_F/0x0F_O/0x0F_P.

6.2.4 3K RC

Timed wake-up is driven by 3K RC, which only operates in Polling Loop.

Clock correction - divided into automatic correction and manual correction:

- Automatic correction: Automatically correct by writing the MStart command with the command code 0101b;
- Manual calibration: Perform manual calibration by configure uring registers.

Related register: 0x0F_A/0x0F_E/0x0F_F.

6.2.5 ARI

This function is used to indicate whether the RF field is turned on during card search. ARI opens 1 us earlier than the RF field and closes 1 us later than the RF field. ARI and D1 pin reuse.

Related register: 0x0F_L/0x0F_J.

7. Register set

7.1 Registers overview

Table7-1 registers overview

Address (HEX)	Register Name	Function
PAGE0: Command and Status		
0	PageReg	Selects the register page
1	CommandReg	Starts and stops command execution
2	CommEnReg	Controls bits to enable and disable the passing of Interrupt Requests
3	DivlEnReg	Controls bits to enable and disable the passing of Interrupt Requests
4	CommIrqReg	Contains Interrupt Request bits
5	DivIrqReg	Contains Interrupt Request bits
6	ErrorReg	Error bits showing the error status of the last command executed
7	Status1Reg	Contains status bits for communication
8	Status2Reg	Contains status bits of the receiver and transmitter
9	FIFODataReg	In and output of 64 byte FIFO-buffer
A	FIFOLevelReg	Indicates the number of bytes stored in the FIFO
B	WaterLevelReg	Defines the level for FIFO under and overflow warning
C	ControlReg	Contains miscellaneous Control Registers
D	BitFramingReg	Adjustments for bit oriented frames
E	CollReg	Bit position of the first bit collision detected on the RF interface
F_A	RCCfg1	3K RC configuration1
F_B	ACRDCfg	RF card and RF field detection
F_C	ManRefVal	Manual mode reference value
F_D	ValDelta	Field strength variation range
F_E	ADCCfg	Polling ADC configuration
F_F	RCCfg2	3K RC configuration2
F_G	ADCVal	Polling ADC sample value
F_H	WdtCnt	Watchdog interval setting
F_I	ARI	ACRD
F_J	RFU	-
F_K	LPDCfg1	Sensor configuration1
F_L	LPDCfg2	Sensor configuration2
F_M	RFLowDetect	Low RF detection during ACD
F_N	ExRFDetect	External RF detection during ACD
F_O	ACRDIRqEn	ACD interrupt enable
F_P	ACRDIRq	ACD interrupt
PAGE1: Communication		

0	PageReg	Selects the register page
1	ModeReg	Defines general modes for transmitting and receiving
2	TxModeReg	Defines the data rate and framing during transmission
3	RxModeReg	Defines the data rate and framing during receiving
4	TxControlReg	Controls the logical behavior of the antenna driver pins TX1 and TX2
5	TxAutoReg	Controls the setting of the antenna drivers
6	TxSelReg	Selects the internal sources for the antenna driver
7	RxSelReg	Selects internal receiver settings
8	RxThresholdReg	Selects thresholds for the bit decoder
9	DemodReg	Defines demodulator settings
A	RFU	-
B	RFU	-
C	MifNFCReg	Controls ISO/IEC 14443
D	ManualRCVReg	Allows manual fine tuning of the internal receiver
E	TypeBReg	Configure the ISO/IEC 14443 type B
F	SerialSpeedReg	Selects the speed of the serial UART interface
PAGE2: Configuration		
0	PageReg	Selects the register page
1	CRCResultReg	Shows the actual MSB and LSB values of the CRC calculation
2		
3	GsNOffReg	Selects the conductance of the antenna driver pins TX1 and TX2 for modulation, when the driver is switched off
4	ModWidthReg	Controls the setting of the ModWidth
5	RFU	-
6	RFCfgReg	Configures the receiver gain and RF level
7	GsNOnReg	Selects the conductance of the antenna driver pins TX1 and TX2 for modulation when the drivers are switched on
8	CWGSPReg	Selects the conductance of the antenna driver pins TX1 and TX2 for modulation during times of no modulation
9	ModGsPReg	Selects the conductance of the antenna driver pins TX1 and TX2 for modulation during modulation
A	TModeReg	Defines settings for the internal timer
B	TPrescalerReg	
C	TReloadReg	Describes the 16-bit timer reload value
D		

E	TCounterValReg	Shows the 16-bit actual timer value
F		
PAGE3: Testing		
0	PageReg	Selects the register page
1	TestSel1Reg	General test signal configuration
2	TestSel2Reg	General test signal configuration and PRBS control
3	TestPinEnReg	Enables pin output driver on 8-bit parallel bus (NOTE: For serial interfaces only)
4	TestPinValueReg	Defines the values for the 8-bit parallel bus when used as I/O bus
5	TestBusReg	Shows the status of the internal testbus
6	AutoTestReg	Controls the digital selftest
7	VersionReg	Shows the version
8	AnalogTestReg	Controls the pins AUX1 and AUX2
9	TestDAC1Reg	Defines the test value for the TestDAC1
A	TestDAC2Reg	Defines the test value for the TestDAC2
B	TestADCReg	Shows the actual value of ADC I and Q
C-F	RFTReg	Reserved for production tests

Depending on the functionality of a register, the access conditions to the register can vary. In principle bits with same behavior are grouped in common registers. In Table 7-2 the access conditions are described

Table7-2 Behavior of register bits and its designation

Abbreviation	Behavior	Description
r/w	read and write	These bits can be written and read by the microcontroller. Since they are used only for control means, there content is not influenced by internal state machines, for example, CommIRqReg may be written and read by the microcontroller. It will also be read by internal state machines, but never changed by them.
dy	dynamic	These bits can be written and read by the microcontroller. Nevertheless, they may also be written automatically by internal state machines, e.g. the Command Register changes its value automatically after the execution of the actual command.

r	Read only	These registers hold bits, which value is determined by internal states only, e.g. the CRCReady bit can not be written from external but shows internal states.
w	Write only	Reading these registers returns always ZERO.
RFU	-	These registers are reserved for future use.
RFT	-	These registers are reserved for production tests and shall not be changed.

7.2 PAGE0: Command and status

7.2.1 PageReg

Table7-3 PageReg Address: 00h reset value: 00h

	7	6	5	4	3	2	1	0
	UsePage Select	Regbank Select	RegSelect				PageSelect	
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-4 PageReg Bit Description

Bit	Symbol	Description
7	UsePageSelect	Set to logic 1, the value of PageSelect is used as register address A5 and A4. The LSB-bits of the register address are defined by the address pins or the internal address latch, respectively. Set to logic 0, the whole content of the internal address latch defines the register address.
6	RegbankSelect	Set to logic 1, it is used to read/write 0Fh register set
5:2	RegSelect	0000: read/write register set A; 0001: read/write register set B; ...

		1111: read/write register set P
1:0	PageSelect	The value of PageSelect is used only if UsePageSelect is set to logic 1. In this case it specifies the register page (which is A5 and A4 of the register address).

7.2.2 CommandReg

Starts and stops command execution.

Table7-5 CommandReg address: 01h;reset value: 20h

	7	6	5	4	3	2	1	0
	AutoPoll	0	RcvOff	Power Down	Command			
Access	dy	RFU	r/w	dy	dy	dy	dy	dy

Table7-6 Description of CommandReg bits

Bit	Symbol	Description
7	AutoPoll	0: Off 1: On Automatically start polling whenever an external cycle signal rising edge is detected. During the polling ,whenever field strength is detected, AutoPoll is set to 0, and generate an interrupt signal,otherwise,enter PowerDown mode, waiting for the next external cycle signal.
6	-	Reserved for future use
5	RcvOff	Set to logic 1, the analog part of the receiver is switched off.
4	PowerDown	Set to logic 1, Soft Power-down mode is entered. Set to logic 0, the Si522A starts the wake up procedure. During this procedure this bit still shows a 1. A 0 indicates that the Si522A is ready for operations. NOTE: The bit Power Down cannot be set, when the command SoftReset has been activated.
3:0	Command	Activates a command according to the Command Code. Reading this register shows which command is actually executed.

7.2.3 CommlEnReg

Control bits to enable and disable the passing of interrupt requests.

Table7-7 CommlEnReg Address: 02h reset value: 80h

	7	6	5	4	3	2	1	0
	IRqInv	TxIEn	RxIEn	IdleIEn	HiAlertIEn	LoAlertIEn	ErrIEn	TimerIEn
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table 7-8 Description of CommlEnReg bits

Bit	Symbol	Description
7	IRqInv	Set to logic 1, the signal on pin IRQ is inverted with respect to bit IRq in the register Status1Reg. Set to logic 0, the signal on pin IRQ is equal to bit IRq. In combination with bit IRqPushPull in register DivIEnReg, the default value of 1 ensures, that the output level on pin IRQ is 3-state.
6	TxIEn	Allows the transmitter interrupt request (indicated by bit TxIRq) to be propagated to pin IRQ.
5	RxIEn	Allows the receiver interrupt request (indicated by bit RxIRq) to be propagated to pin IRQ.
4	IdleIEn	Allows the idle interrupt request (indicated by bit IdleIRq) to be propagated to pin IRQ.
3	HiAlertIEn	Allows the high alert interrupt request (indicated by bit HiAlertIRq) to be propagated to pin IRQ.
2	LoAlertIEn	Allows the low alert interrupt request (indicated by bit LoAlertIRq) to be propagated to pin IRQ.
1	ErrIEn	Allows the error interrupt request (indicated by bit ErrIRq) to be propagated to pin IRQ.
0	TimerIEn	Allows the timer interrupt request (indicated by bit TimerIRq) to be propagated to pin IRQ.

7.2.4 DivlEnReg

Control bits to enable and disable the passing of interrupt requests.

Table 7-9 DivIrqReg address: 03h reset value: 00h

	7	6	5	4	3	2	1	0
	IRQPushPull	CardIRqEn	WdtIRqEn	SiginActIEn	RFU	CRCIEn	RFU	RFU
Access	r/w	r/w	r/w	r/w	-	r/w	-	-

Table 7-10 Description of DivlEnReg bits

Bit	Symbol	Description
7	IRQPushPull	Set to logic 1, the pin IRQ works as standard CMOS output pad. Set to logic 0, the pin IRQ works as open drain output pad.
6	CardIRqEn	Field strength interrupt 1: enable 0: disable
5	WdtIRqEn	Timed wake-up enable 1: enable 0: disable
4	MFINActIEn	Allows the MFIN active interrupt request to be propagated to pin IRQ.
3	RFU	-
2	CRCIEn	Allows the CRC interrupt request (indicated by bit CRCIRq) to be propagated to pin IRQ.
1	RFU	-
0	RFU	-

7.2.5 CommIrqReg

Contains Interrupt Request bits.

Table 7-11 CommIrqReg address: 04h reset value: 14h

	7	6	5	4	3	2	1	0
	Set1	TxIRq	RxIRq	IdleIRq	HiAlertIRq	LoAlertIRq	ErrIRq	TimerIRq
Access	w	dy	dy	dy	dy	dy	dy	dy

Table 7-12 Description of CommIrqReg

Bit	Symbol	Description
7	Set1	Set to logic 1, Set1 defines that the marked bits in the register CommIrqReg are set. Set to logic 0, Set1 defines, that the marked bits in the register CommIrqReg are cleared.
6	TxIRq	Set to logic 1 immediately after the last bit of the transmitted data was sent out.
5	RxIRq	Set to logic 1 when the receiver detects the end of a valid datastream. If the bit RxNoErr in register RxModeReg is set to logic 1, bit RxIRq is only set to logic 1 when data bytes are available in the FIFO.
4	IdleIRq	Set to logic 1, when a command terminates by itself e.g. when the CommandReg changes its value from any command to the Idle Command. If an unknown command is started, the CommandReg changes its content to the idle state and the bit IdleIRq is set. Starting the Idle Command by the microcontroller does not set bit IdleIRq.
3	HiAlertIRq	Set to logic 1, when bit HiAlert in register Status1Reg is set. In opposition to HiAlert, HiAlertIRq stores this event and can only be reset as indicated by bit Set1.
2	LoAlertIRq	Set to logic 1, when bit LoAlert in register Status1Reg is set. In opposition to LoAlert, LoAlertIRq stores this event and can only be reset as indicated by bit Set1.
1	ErrIRq	Set to logic 1 if any error bit in the Error Register is set.
0	TimerIRq	Set to logic 1 when the timer decrements the TimerValue Register to zero.

7.2.6 DivIrqReg

Contains Interrupt Request bits。

Table 7-10 DivIrqReg address: 05h reset value: xxh, 000x00xxb

	7	6	5	4	3	2	1	0
	Set2	CardIRq	WdtIRq	SiginActIRq	RFU	CRCIRq	RFU	RFU
Access	w	dy	dy	dy	-	dy	-	-

Table7-11 Description of DivIRqReg bits

Bit	Symbol	Description
7	Set2	Set to logic 1, Set2 defines that the marked bits in the register DivIRqReg are set. Set to logic 0, Set2 defines that the marked bits in the register DivIRqReg are cleared
6	CardIRq	Field strength interrupt 1: card present 0: no card
5	WdtIRq	Timed wake-up interrupt 1: occurrence 0: not occurred
4	MFINActIRq	Set to logic 1, when MFIN is active. This interrupt is set when either a rising or falling signal edge is detected.
3	RFU	-
2	CRCIRq	Set to logic 1, when the CRC command is active and all data are processed.
1	RFU	-
0	RFU	-

7.2.7 ErrorReg

Error bit register showing the error status of the last command executed.

Table7-13 ErrorReg Address: 06h reset value: 00h

	7	6	5	4	3	2	1	0
--	---	---	---	---	---	---	---	---

	WrErr	TempErr	RFU	BufferOvfl	CollErr	CRCErr	ParityErr	ProtocolErr
Access	r	r	-	r	r	r	r	r

Table7-14 ErrorReg Bit Description

Bit	Symbol	Description
7	WrErr	Set to logic 1, if data is written into FIFO by the host controller during the time between sending the last bit on the RF interface and receiving the last bit on the RF interface.
6	TempErr	Set to logic 1, if the internal temperature sensor detects overheating. In this case, the antenna drivers are switched off automatically.
5	RFU	-
4	BufferOvfl	Set to logic 1, if the host controller or a Si522A's internal state machine (e.g. receiver) tries to write data into the FIFO-buffer although the FIFO-buffer is already full.
3	CollErr	Set to logic 1, if a bit-collision is detected. It is cleared automatically at receiver start-up phase. This bit is only valid during the bitwise anticollision at 106 kbit/s. During communication schemes at 212 and 424 kbit/s this bit is always set to logic 1.
2	CRCErr	Set to logic 1, if bit RxCRCEn in register RxModeReg is set and the CRC calculation fails. It is cleared to 0 automatically at receiver start-up phase.
1	ParityErr	Set to logic 1, if the parity check has failed. It is cleared automatically at receiver start-up phase. Only valid for ISO/IEC 14443A or NFCIP-1 communication at 106 kbit.
0	ProtocolErr	Set to logic 1 if the SOF is incorrect. It is cleared automatically at receiver start-up phase. The bit is only valid for 106 kbit in Active and Passive Communication mode.

NOTE: Command execution will clear all error bits except for bit TempErr. A setting by software is impossible.

7.2.8 Status1Reg

Contains status bits of the CRC, Interrupt and FIFO-buffer.

Table7-15 Status1Reg Address: 07h reset value: xxh, x100x01xb

	7	6	5	4	3	2	1	0
	RFU	CRCOk	CRCReady	IRq	TRunning	RFU	HiAlert	LoAlert
Access	-	r	r	r	r	-	r	r

Table7-16 Status1Reg Bit Description

Bit	Symbol	Description
7	RFU	-
6	CRCOk	Set to logic 1, if the CRC Result is zero. For data transmission and reception the bit CRCOk is undefined (use CRCErr in register ErrorReg). CRCOk indicates the status of the CRC co-processor, during calculation the value changes to ZERO, when the calculation is done correctly, the value changes to ONE.
5	CRCReady	Set to logic 1, when the CRC calculation has finished. This bit is only valid for the CRC co-processor calculation using the command CalcCRC.
4	IRq	This bit shows, if any interrupt source requests attention (with respect to the setting of the interrupt enable bits, see register CommIEnReg and DivIEnReg).
3	TRunning	Set to logic 1, if the Si522A' s timer unit is running, e.g. the timer will decrement the TCounterValReg with the next timer clock. NOTE: In the gated mode the bit TRunning is set to logic 1, when the timer is enabled by the register bits. This bit is not influenced by the gated signal.
2	RFU	-
1	HiAlert	Set to logic 1, when the number of bytes stored in the FIFO-buffer fulfills the following equation: $\text{HiAlert} = (64 - \text{FIFOLength}) \leq \text{WaterLevel}$

0	LoAlert	Set to logic 1, when the number of bytes stored in the FIFO-buffer fulfills the following equation: $LoAlert = FIFOLength \leq WaterLevel$
---	---------	--

7.2.9 Status2Reg

Status bits of receiver, transmitter, and data detectors

Table7-17 Status2Reg Address: 08h reset value: 00h

	7	6	5	4	3	2	1	0
	TempSensClear	I ² CForceHS	RFU	RFU	MFCrypto1On	Modem State		
Access	r/w	r/w	-	-	dy	r	r	r

Table7-18 Status2Reg Bit Description

Bit	Symbol	Description
7	TempSensClear	Set to logic 1, this bit clears the temperature error, if the temperature is below the alarm limit of 125 ° C.
6	I2CForceHS	I2C input filter settings. Set to logic 1, the I2C input filter is set to the High-speed mode independent of the I2C protocol. Set to logic 0, the I2C input filter is set to the used I2C protocol.
5:3	RFU	-
2:0	Modem State	ModemState shows the state of the transmitter and receiver state machines.

		Value	Description
		000	IDLE
		001	Wait for StartSend in register BitFramingReg
		010	TxWait: Wait until RF field is present, if the bit TxWaitRF is set to logic 1. The minimum time for TxWait is defined by the TxWaitReg register.
		011	Sending
		100	RxWait: Wait until RF field is present, if the bit RxWaitRF is set to logic 1. The minimum time for RxWait is defined by the RxWait in the RxSelReg register.
		101	Wait for data
		110	Receiving

7.2.10 FIFODataReg

In and output of 64 byte FIFO-buffer.

Table7-19 FIFODataReg Address: 09h reset value: xxh, xxxxxxxxb

	7	6	5	4	3	2	1	0
	FIFOData							
Access	dy	dy	dy	dy	dy	dy	dy	dy

Table7-20 FIFODataReg Bit Description

Bit	Symbol	Description
7:0	FIFOData	Data input and output port for the internal 64 byte FIFO buffer. The FIFO buffer acts as parallel in/parallel out converter for all serial data stream in and outputs.

7.2.11 FIFOLevelReg

Indicates the number of bytes stored in the FIFO.

Table7-21 PageReg Address: 0Ah reset value: 00h

	7	6	5	4	3	2	1	0
	FlushBuffer	FIFOLevel						
Access	w	r	r	r	r	r	r	r

Table7-22 PageReg Bit Description

Bit	Symbol	Description
7	FlushBuffer	Set to logic 1, this bit clears the internal FIFO-buffers read and write pointer and the bit BufferOvfl in the register ErrReg immediately. Reading this bit will always return 0.
6:0	FIFOLevel	Indicates the number of bytes stored in the FIFO-buffer. Writing to the FIFODataReg increments, reading decrements the FIFOLevel.

7.2.12 WaterLevelReg

Defines the level for FIFO under- and overflow warning.

Table7-23 WaterLevelReg Address: 0Bh reset value: 08h

	7	6	5	4	3	2	1	0
	0	0	WaterLevel					
Access	RFU	RFU	r/w	r/w	r/w	r/w	r/w	r/w

Table7-24 WaterLevelReg Bit Description

Bit	Symbol	Description
7:6	-	Reserved for future use.
5:0	WaterLevel	This register defines a warning level to indicate a FIFO-buffer over- or underflow: The bit HiAlert in Status1Reg is set to logic 1, if the remaining number of bytes in the FIFO-buffer space is equal or less than the defined number of WaterLevel bytes.

		The bit LoAlert in Status1Reg is set to logic 1, if equal or less than WaterLevel bytes are in the FIFO.
--	--	--

7.2.13 ControlReg

Control bit。

Table7-25 ControlReg Address: 0Ch reset value: 00h

	7	6	5	4	3	2	1	0
	TStopNow	TStartNow	RFU	RFU	RFU	RxLastBits		
Access	w	w	-	-	-	r	r	r

Table7-26 ControlReg Bit Description

Bit	Symbol	Description
7	TStopNow	Set to logic 1, the timer stops immediately. Reading this bit will always return 0.
6	TStartNow	Set to logic 1 starts the timer immediately. Reading this bit will always return 0.
5:3	RFU	-
2:0	RxLastBits	RxLastBits Shows the number of valid bits in the last received byte. If zero, the whole byte is valid.

7.2.14 BitFramingReg

Adjustments for bit oriented frames.

Table7-27 BitFramingReg Address: 0Dh reset value: 00h

	7	6	5	4	3	2	1	0
	StartSend	RxAlign			0	TxLastBits		
Access	w	r/w	r/w	r/w	RFU	r/w	r/w	r/w

Table7-28 BitFramingReg Bit Description

Bit	Symbol	Description
7	StartSend	Set to logic 1, the transmission of data starts. This bit is only valid in combination with the Transceive command.
6:4	RxAlign	Used for reception of bit oriented frames: RxAlign defines the bit position for the first bit received to be stored in the FIFO. Further received bits are stored at the following bit positions. Example: RxAlign = 0: the LSB of the received bit is stored at bit 0, the second received bit is stored at bit position 1. RxAlign = 1: the LSB of the received bit is stored at bit 1, the second received bit is stored at bit position 2. RxAlign = 7: the LSB of the received bit is stored at bit 7, the second received bit is stored in the following byte at bit position 0. This bit shall only be used for bitwise anticollision at 106 kbit/s in Passive Communication mode. In all other modes it shall be set to logic 0.
3	-	Reserved for future use.
2:0	TxLastBits	Used for transmission of bit oriented frames: TxLastBits defines the number of bits of the last byte that shall be transmitted. A 000 indicates that all bits of the last byte shall be transmitted.

7.2.15 CollReg

Defines the first bit collision detected on the RF interface.

Table7-29 CollReg Address: 0Eh reset value: xxh, 101xxxxb

	7	6	5	4	3	2	1	0
	Values	0	CollPos	CollPos				
	AfterColl		NotValid					
Access	r/w	RFU	r	r	r	r	r	r

Table7-30 CollReg Bit Description

Bit	Symbol	Description
-----	--------	-------------

7	ValuesAfterColl	If this bit is set to logic 0, all receiving bits will be cleared after a collision. This bit shall only be used during bitwise anticollision at 106 kbit, otherwise it shall be set to logic 1.
6	-	Reserved for future use.
5	CollPosNotValid	Set to logic 1, if no Collision is detected or the Position of the Collision is out of the range of bits CollPos. This bit shall only be interpreted in Passive Communication mode at 106 kbit or ISO/IEC 14443A Reader/Writer mode.
4:0	CollPos	These bits show the bit position of the first detected collision in a received frame, only data bits are interpreted. Example: 00h indicates a bit collision in the 32th bit 01h indicates a bit collision in the 1st bit 08h indicates a bit collision in the 8th bit These bits shall only be interpreted in Passive Communication mode at 106 kbit or ISO/IEC 14443A Reader/Writer mode if bit CollPosNotValid is set to logic 0

7.2.16 PollReg

Address 0x0F includes 16 register files, and selects which group to access by address 0x00/0x10/0x20/0x30

Table7-31 PollReg Address: 0Fh reset value: xxh

Address	Bit	Symbol	Access	reset value	Description

7.3 PAGE1: communication

7.3.1 PageReg

Table7-33 PageReg Address: 10h reset value: 00h

	7	6	5	4	3	2	1	0
	UsePage Select	Regbank Select	RegSelect				PageSelect	
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-34 PageReg Bit Description

Bit	Symbol	Description
7	UsePageSelect	Set to logic 1, the value of PageSelect is used as register address A5 and A4. The LSB-bits of the register address are defined by the address pins or the internal address latch, respectively. Set to logic 0, the whole content of the internal address latch defines the register address. The address pins are used as described in Section 8.1 “Automatic microcontroller interface detection” .
6	RegbankSelect	Set to logic 1, it is used to read/write 0Fh register set
5:2	RegSelect	0000: read/write register set A; 0001: read/write register set B; ... 1111: read/write register set P
1:0	PageSelect	The value of PageSelect is used only, if UsePageSelect is set to logic 1. In this case it specifies the register page (which is A5 and A4 of the register address).

7.3.2 ModeReg

Defines general mode settings for transmitting and receiving.

Table7-35 ModeReg Address: 11h reset value: 3Bh

	7	6	5	4	3	2	1	0
	MSBFirst	RFU	TxWaitRF	RFU	PolSigin	RFU	CRCPreset	
Access	r/w	-	r/w	-	r/w	-	r/w	r/w

Table7-36 ModeReg Bit Description

Bit	Symbol	Description	
7	MSBFirst	Set to logic 1, the CRC co-processor calculates the CRC with MSB first and the CRCResultMSB and the CRCResultLSB in the CRCResultReg register are bit reversed. NOTE: During RF communication this bit is ignored.	
6	RFU	-	
5	TxWaitRF	Set to logic 1 the transmitter in reader/writer or initiator mode for NFCIP-1 can only be started, if an RF field is generated.	
4	RFU	-	
3	PolSigin	Defines the polarity of the MFIN pin. Set to logic 1, the polarity of MFIN pin is active high. Set to logic 0 the polarity of MFIN pin is active low. NOTE: The internal envelope signal is coded active low. Changing this bit will generate a SiginActIRq interrupt.	
2	RFU	-	
1:0	CRCPreset	Defines the preset value for the CRC co-processor for the command CalCRC.	
		Value	Description
		00	0000
		01	6363
		10	A671
		11	FFFF

7.3.3 TxModeReg

Defines the data rate and framing during transmission

Table7-37 TxModeReg Address: 12h reset value: 00h

	7	6	5	4	3	2	1	0
	TxCRCEn	TxSpeed			InvMod	TxMix	TxFraming	
Access	r/w	dy	dy	dy	r/w	r/w	dy	dy

Table7-38 TxModeReg Bit Description

Bit	Symbol	Description	
7	TxCRCEn	Set to logic 1, this bit enables the CRC generation during data transmission. NOTE: This bit shall only be set to logic 0 at 106 kbit.	
6:4	TxSpeed	Defines the bit rate while data transmission.	
		Value	Description
		000	106kbits/s
		001	212kbits/s
		010	424kbits/s
		011	848kbits/s
		100	Reserved
		101	Reserved
		110	Reserved
		111	Reserved
3	InvMod	Set to logic 1, the modulation for transmitting data is inverted.	
2	TxMix	Set to logic 1, the signal at pin MFIN is mixed with the internal coder	
1:0	TxFraming	Defines the framing used for data transmission.	
		Value	Description
		00	ISO/IEC 14443A
		01	Reserved
		10	Reserved

		11	Reserved

7.3.4 RxModeReg

Defines the data rate and framing during reception.

Table7-39 RxModeReg Address: 13h reset value: 00h

	7	6	5	4	3	2	1	0
	RxCRCEn	RxSpeed			RxNoErr	RxMultiple	RxFraming	
Access	r/w	dy	dy	dy	r/w	r/w	dy	dy

Table7-40 RxModeReg Bit Description

Bit	Symbol	Description	
7	RxCRCEn	Set to logic 1, this bit enables the CRC calculation during reception. NOTE: This bit shall only be set to logic 0 at 106 kbit.	
6:4	RxSpeed	Defines the bit rate while data transmission. The Si522A's analog part handles only transfer speeds up to 424 kbit internally, the digital UART handles the higher transfer speeds as well.	
		Value	Description
		000	106kbits/s
		001	212kbits/s
		010	424kbits/s
		011	848kbits/s
		100	Reserved
		101	Reserved
		110	Reserved
		111	Reserved
3	RxNoErr	If set to logic 1 a not valid received data stream (less than 4 bits received) will be ignored. The receiver will remain active.	
2	RxMultiple	Set to logic 0, the receiver is deactivated after receiving a data frame. Set to logic 1, it is possible to receive more than one data frame. Having	

		set this bit, the receive and transceive commands will not terminate automatically. In this case the multiple receiving can only be deactivated by writing any command (except the Receive command) to the CommandReg register or by clearing the bit by the host controller. At the end of a received data stream an error byte is added to the FIFO. The error byte is a copy of the ErrorReg register.	
1:0	RxFraming	Defines the expected framing for data reception.	
		Value	Description
		00	ISO/IEC 14443A
		01	Reserved
		10	Reserved
		11	Reserved

7.3.5 TxControlReg

Controls the logical behavior of the antenna driver pins Tx1 and Tx2.

Table7-40 TxControlReg Address: 14h reset value: 80h

	7	6	5	4	3	2	1	0
	InvTx2RF On	InvTx1RF On	InvTx2RF Off	InvTx1RF Off	Tx2CW	RFU	Tx2RF En	Tx1RF En
Access	r/w	r/w	r/w	r/w	r/w	-	r/w	r/w

Table7-41 TxControlReg Bit Description

Bit	Symbol	Description
7	InvTx2RFOn	Set to logic 1, the output signal at pin TX2 will be inverted, if driver TX2 is enabled.
6	InvTx1RFOn	Set to logic 1, the output signal at pin TX1 will be inverted, if driver TX1 is enabled.
5	InvTx2RFOff	Set to logic 1, the output signal at pin TX2 will be inverted, if driver TX2 is enabled.
4	InvTx1RFOff	Set to logic 1, the output signal at pin TX1 will be inverted, if driver TX1

		is enabled.
3	Tx2CW	Set to logic 1, the output signal on pin TX2 will deliver continuously the un-modulated 13.56 MHz energy carrier. Set to logic 0, Tx2CW is enabled to modulate the 13.56 MHz energy carrier.
2	RFU	-
1	Tx2RFEn	Set to logic 1, the output signal on pin TX2 will deliver the 13.56 MHz energy carrier modulated by the transmission data.
0	Tx1RFEn	Set to logic 1, the output signal on pin TX1 will deliver the 13.56 MHz energy carrier modulated by the transmission data.

7.3.6 TxAutoReg

Controls the settings of the antenna driver.

Table7-42 TxAutoReg Address: 15h reset value: 00h

	7	6	5	4	3	2	1	0
	RFU	Force100 ASK	RFU	RFU	RFU	RFU	RFU	RFU
Access	-	r/w	-	-	-	-	-	-

Table7-43 TxAutoReg Bit Description

Bit	Symbol	Description
7	RFU	-
6	Force100ASK	Set to logic 1, Force100ASK forces a 100% ASK modulation independent of the setting in register ModGsPReg.
5:0	RFU	-

7.3.7 TxSelReg

Selects the sources for the analog part.

Table7-44 TxSelReg Address: 16h reset value: 10h

	7	6	5	4	3	2	1	0
	0	0	DriverSel		SigOutSel			
Access	RFU	RFU	r/w	r/w	r/w	r/w	r/w	r/w

Table7-45 TxSelReg Bit Description

Bit	Symbol	Description	
7:6	-	Reserved for future use.	
5:4	DriverSel	Selects the input of driver Tx1 and Tx2.	
		value	Description
		00	Tristate NOTE: In soft power down the drivers are only in Tristate mode if DriverSel is set to Tristate mode.
		01	Modulation signal (envelope) from the internal coder
		10	Modulation signal (envelope) from MFIN
		11	HIGH NOTE: The HIGH level depends on the setting of InvTx1RFOn/InvTx1RFOff and InvTx2RFOn/InvTx2RFOff.
3:0	SigOutSel	Selects the input for the MFOUT Pin.	
		value	Description
		0000	Tristate
		0001	Low
		0010	High
		0011	TestBus signal as defined by bit TestBusBitSel in register TestSel1Reg.
		0100	Serial data stream to be transmitted after modulation
		0101	Serial data stream to be transmitted before modulation
		0110	Reserved
		0111	Data received after modulation
		1000-1011	Reserved

7.3.8 RxSelReg

Selects internal receiver settings.

Table7-46 RxSelReg Address: 17h reset value: 84h

	7	6	5	4	3	2	1	0
	UartSel		RxWait					
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-47 RxSelReg Bit Description

Bit	Symbol	Description	
7:6	UartSel	Selects the input of the contactless UART	
		Value	Description
		00	Constant Low
		01	Envelope signal at MFIN
		10	Modulation signal from the internal analog part
		11	NRZ signal without carrier, only effect at 106kbps
5:0	RxWait	After data transmission, the activation of the receiver is delayed for RxWait bit-clocks. During this ‘frame guard time’ any signal at pin RX is ignored. This parameter is ignored by the Receive command. All other commands (e.g. Transceive) use this parameter. Depending on the mode of the Si522A, the counter starts different. In Passive Communication mode the counter starts with the last modulation pulse of the transmitted data stream. In Active Communication mode the counter starts immediately after the external RF field is switched on.	

7.3.9 RxThresholdReg

Selects thresholds for the bit decoder.

Table7-48 RxThresholdReg Address: 18h reset value: 84h

	7	6	5	4	3	2	1	0
	MinLevel				0	CollLevel		

Access	r/w	r/w	r/w	r/w	RFU	r/w	r/w	r/w
--------	-----	-----	-----	-----	-----	-----	-----	-----

Table7-49 RxThresholdReg Bit Description

Bit	Symbol	Description
7:4	MinLevel	Defines the minimum signal strength at the decoder input that shall be accepted. If the signal strength is below this level, it is not evaluated.
3	-	Reserved for future use.
2:0	CollLevel	Defines the minimum signal strength at the decoder input that has to be reached by the weaker half-bit of the Manchester-coded signal to generate a bit-collision relatively to the amplitude of the stronger half-bit.

7.3.10 DemodReg

Defines demodulator settings.

Table7-50 DemodReg Address: 19h reset value: 4Dh

	7	6	5	4	3	2	1	0
	AddIQ		FixIQ	TPrescal Even	TauRcv		TauSync	
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-51 DemodReg Bit Description

Bit	Symbol	Description	
7:6	AddIQ	Defines the use of I and Q channel during reception	
		NOTE: FixIQ has to be set to logic 0 to enable the following settings.	
		Value	Description
		00	Select the stronger channel
		01	Select the stronger and freeze the selected during communication
		10	combines the I and Q channel
11	Reserved		
5	FixIQ	If set to logic 1 and the bits of AddIQ are set to X0, the reception is fixed to	

		I channel. If set to logic 1 and the bits of AddIQ are set to X1, the reception is fixed to Q channel. NOTE: If MFIN/MFOUT is used as S2C interface FixIQ set to 1 and AddIQ set to X0 is rewired.
4	TPrescalEven	If set to logic 0 the following formula is used to calculate fTimer of the prescaler: $fTimer = 13.56 \text{ MHz} / (2 * TPreScaler + 1).$ If set to logic 1 the following formula is used to calculate fTimer of the prescaler: $fTimer = 13.56 \text{ MHz} / (2 * TPreScaler + 2).$ (Default TPrescalEven is logic 0)
3:2	TauRcv	Changes the time constant of the internal during data reception. NOTE: If set to 00, the PLL is frozen during data reception.
1:0	TauSync	Changes the time constant of the internal PLL during burst.

7.3.11 RFU

Reserved for future use.

7.3.12 RFU

Reserved for future use.

7.3.13 MifNFCReg

Defines ISO/IEC 14443A/NFC specific settings in target or Card Operating mode.

Table7-56 MifNFCReg Address: 1Ch reset value: 62h

	7	6	5	4	3	2	1	0
	RFU			RFU		RFU	Txwait	
Access	-	-	-	-	-	-	r/w	r/w

Table7-57 MifNFCReg Bit Description

Bit	Symbol	Description
7:2	RFU	-

1:0	Txwait	These bits define the minimum response time between receive and transmit in number of data bits + 7 data bits. The shortest possible minimum response time is 7 data bits. (TxWait=0). The minimum response time can be increased by the number of bits defined in TxWait. The longest minimum response time is 10 data bits (TxWait = 3). If a transmission of a frame is started before the minimum response time is over, the Si522A waits before transmitting the data until the minimum response time is over, and the frame is started immediately if the data bit synchronization is correct. (adjustable with TxBitPhase).
-----	--------	--

7.3.14 ManualRCVReg

Allows manual fine tuning of the internal receiver.

NOTE: For standard applications it is not recommended to change this register settings.

Table7-58 ManualRCVReg Address: 1Dh reset value: 00h

	7	6	5	4	3	2	1
	RFU	RFU	RFU	Parity Disable	RFU	RFU	RFU
Access	-	-	-	r/w	-	-	-

Table7-59 ManualRCVReg Bit Description

Bit	Symbol	Description
7:5	RFU	-
4	ParityDisable	If this bit is set to logic 1, the generation of the Parity bit for transmission and the Parity-Check for receiving is switched off. The received Parity bit is handled like a data bit.
3:0	RFU	-

7.3.15 RFU

Reserved for future use.

7.3.16 SerialSpeedReg

Selects the speed of the serial UART interface.

Table7-62 SerialSpeedReg Address: 1Fh reset value: EBh

	7	6	5	4	3	2	1	0
	BR_T0			BR_T1				
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-63 SerialSpeedReg Bit Description

Bit	Symbol	Description
7:5	BR_T0	Factor BR_T0 to adjust the transfer speed, for description see Section 8.3.2 “Selectable UART transfer speeds”.
4:0	BR_T1	Factor BR_T1 to adjust the transfer speed, for description see Section 8.3.2 “Selectable UART transfer speeds”.

7.4 PAGE2: configuration

7.4.1 PageReg

Table7-64 PageReg Address: 20h reset value: 00h

	7	6	5: 2	1	0
	UsePageSelect	RegbankSelect	RegSelect	PageSelect	
Access	r/w	r/w	r/w	r/w	r/w

Table7-65 PageReg Bit Description

Bit	Symbol	Description
7	UsePageSelect	Set to logic 1, the value of PageSelect is used as register address A5 and A4. The LSB-bits of the register address are defined by the address pins or the internal address latch, respectively. Set to logic 0, the whole content of the internal address latch defines the register address.
6	RegbankSelect	Set to logic 1, it is used to read/write 0Fh register set
5:2	RegSelect	0000: read/write register set A; 0001: read/write register set B; ... 1111: read/write register set P
1:0	PageSelect	The value of PageSelect is used only if UsePageSelect is set to logic 1. In this case, it specifies the register page (which is A5 and A4 of the register address).

7.4.2/3 CRCResultReg

Shows the actual MSB and LSB values of the CRC calculation.

NOTE: The CRC is split into two 8-bit register. Setting the bit MSBFirst in ModeReg register reverses the bit order, the byte order is not changed.

Table7-66 CRCResultReg Address: 21h reset value: FFh

	7	6	5	4	3	2	1	0
	CRCResultMSB							

Access	r	r	r	r	r	r	r	r
--------	---	---	---	---	---	---	---	---

Table7-67 CRCResultReg Bit Description

Bit	Symbol	Description
7	CRCResultMSB	This register shows the actual value of the most significant byte of the CRCResultReg register. It is valid only if bit CRCReady in register Status1Reg is set to logic 1.

Table7-68 CRCResultReg Address: 22h reset value: FFh

	7	6	5	4	3	2	1	0
	CRCResultLSB							
Access	r	r	r	r	r	r	r	r

Table7-69 CRCResultReg Bit Description

Bit	Symbol	Description
7	CRCResultLSB	This register shows the actual value of the most significant byte of the CRCResultReg register. It is valid only if bit CRCReady in register Status1Reg is set to logic 1.

7.4.4 GsNOffReg

Selects the conductance for the N-driver of the antenna driver pins TX1 and TX2 when the driver is switched off.

Table7-70 GsNOffReg Address: 23h reset value: 88h

	7	6	5	4	3	2	1	0
	CWGsNOff				ModGsNOff			
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-71 GsNOffReg Bit Description

Bit	Symbol	Description
7:4	CWGsNOff	This value is used for LoadModulation. The value of this register defines the conductance of the output N-driver during times of no modulation. NOTE: The conductance value is binary weighted. During soft Power-down mode the highest bit is forced to 1. The value of the register is only used if the driver is switched off. Otherwise the bit value CWGsNOn of register GsNOnReg is used
3:0	ModGsNOff	This value is used for LoadModulation. The value of this register defines the conductance of the output N-driver for the time of modulation. This may be used to regulate the modulation index. NOTE: The conductance value is binary weighted. During soft Power-down mode the highest bit is forced to 1. The value of the register is only used if the driver is switched off. Otherwise the bit value ModGsNOn of register GsNOnReg is used

7.4.5 ModWidthReg

Controls the modulation width settings.

Table7-72 ModWidthReg Address: 24h reset value: 26h

	7	6	5	4	3	2	1	0
	ModWidth							
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-73 ModWidthReg Bit Description

Bit	Symbol	Description
7:0	ModWidth	These bits define the width of the Miller modulation as initiator in Active and Passive Communication mode as multiples of the carrier frequency ($\text{ModWidth} + 1/\text{fc}$). The maximum value is half the bit period. Acting as a target in Passive Communication mode at 106 kbit or in

		Card Operating mode for ISO/IEC 14443A these bits are used to change the duty cycle of the subcarrier frequency. The resulting number of carrier periods are calculated according to the following formulas: LOW value: $\#clocks_{LOW} = (\text{ModWidth modulo } 8) + 1$. HIGH value: $\#clocks_{HIGH} = 16 - \#clocks_{LOW}$.
--	--	--

7.4.6 RFU

Reserved for future use.

7.4.7 RFCfgReg

Configures the receiver gain and RF level detector sensitivity.

Table7-76 RFCfgReg Address: 26h reset value: 48h

	7	6	5	4	3	2	1	0
	RFU	RxGain				RFU		
Access	-	r/w	r/w	r/w	r/w	-		

Table7-77 RFCfgReg Bit Description

Bit	Symbol	Description	
7	RFU	-	
6:3	RxGain	This register defines the receivers signal voltage gain factor:	
		Value	Gain
		000	18dB
		001	23dB
		010	18dB
		011	23dB
		100	33dB
		101	38dB
		110	43dB
		111	48dB
2:0	RFU	-	

7.4.8 GsNOnReg

Selects the conductance for the N-driver of the antenna driver pins TX1 and TX2 when the driver is switched on.

Table7-78 GsNOnReg Address: 27h reset value: 88h

	7	6	5	4	3	2	1	0
	CWGsNOn				ModGsNOn			
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-79 GsNOnReg Bit Description

Bit	Symbol	Description
7:4	CWGsnOn	The value of this register defines the conductance of the output N-driver during times of no modulation. This may be used to regulate the output power and subsequently current consumption and operating distance. NOTE: The conductance value is binary weighted. During soft Power-down mode the highest bit is forced to 1. This value is only used if the driver TX1 or TX2 are switched on. Otherwise the value of the bits CWGsNOFF of register GsNOFFReg is used.
3:0	ModGsNOn	The value of this register defines the conductance of the output N-driver for the time of modulation. This may be used to regulate the modulation index. NOTE: The conductance value is binary weighted. During soft Power-down mode the highest bit is forced to 1. This value is only used if the driver TX1 or Tx2 are switched on. Otherwise the value of the bits ModsNOFF of register GsNOFFReg is used.

7.4.9 CWGsPReg

Defines the conductance of the P-driver during times of no modulation

Table7-80 CWGsPReg Address: 28h reset value: 20h

	7	6	5	4	3	2	1	0
--	---	---	---	---	---	---	---	---

	0	0	CWGsP					
Access	RFU	RFU	r/w	r/w	r/w	r/w	r/w	r/w

Table7-81 CWGsPReg Bit Description

Bit	Symbol	Description
7:6	-	Reserved for future use.
5:0	CWGSP	The value of this register defines the conductance of the output P-driver. This may be used to regulate the output power and subsequently current consumption and operating distance. NOTE: The conductance value is binary weighted. During soft Power-down mode the highest bit is forced to 1.

7.4.10 ModGsPReg

Defines the driver P-output conductance during modulation.

Table7-82 ModGsPReg Address: 29h reset value: 20h

	7	6	5	4	3	2	1	0
	0	0	ModGsP					
Access	RFU	RFU	r/w	r/w	r/w	r/w	r/w	r/w

Table7-83 ModGsPReg Bit Description

Bit	Symbol	Description
7:6	-	Reserved for future use.
5:0	ModGsP	The value of this register defines the conductance of the output P-driver for the time of modulation. This may be used to regulate the modulation index. NOTE: The conductance value is binary weighted. During soft Power-down mode the highest bit is forced to 1.

7.4.11/12 TModeReg, TPrescalerReg

Defines settings for the timer.

NOTE: The Prescaler value is split into two 8-bit registers

Table7-84 TModeReg Address: 2Ah reset value: 00h

	7	6	5	4	3	2	1	0
	TAuto	TGated		TAutoRestart	TPrescaler_Hi			
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-85 TModeReg Bit Description

Bit	Symbol	Description	
7	TAuto	Set to logic 1, the timer starts automatically at the end of the transmission in all communication modes at all speeds or when bit InitialRFOn is set to logic 1 and the RF field is switched on. In mode ISO14443-B 106kbit/s the timer stops after the 5th bit (1 startbit, 4 databits) if the bit RxMultiple in the register RxModeReg is not set. In all other modes, the timer stops after the 4th bit if the bit RxMultiple the register RxModeReg is not set. If RxMultiple is set to logic 1, the timer never stops. In this case the timer can be stopped by setting the bit TStopNow in register ControlReg to 1. Set to logic 0 indicates, that the timer is not influenced by the protocol.	
6:5	TGated	The internal timer is running in gated mode. NOTE: In the gated mode, the bit TRunning is 1 when the timer is enabled by the register bits. This bit does not influence the gating signal.	
		Value	Description
		00	Non gated mode
		01	Gated by MFIN
		10	Gated by AUX1
		11	Gated by A3
4	TAutoRestart	Set to logic 1, the timer automatically restart its count-down from TReloadValue, instead of counting down to zero.	

		Set to logic 0 the timer decrements to ZERO and the bit TimerIRQ is set to logic 1.
3:0	TPrescaler_Hi	Defines higher 4 bits for TPrescaler. The following formula is used to calculate fTimer if TPrescalEven bit in DemodReg is set to logic 0: $fTimer = 13.56MHz / (2 * TPreScaler + 1)$ Where TPreScaler = [TPrescaler_Hi:TPrescaler_Lo] (TPrescaler value on 12 bits) (Default TPrescalEven is logic 0) The following formula is used to calculate fTimer if TPrescalEven bit in DemodReg is set to logic 1: $fTimer = 13.56MHz / (2 * TPreScaler + 2)$

Table7-86 TPrescalerReg Address: 2Bh reset value: 00h

	7	6	5	4	3	2	1	0
	TPrescaler_Lo							
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-87 TPrescalerReg Bit Description

Bit	Symbol	Description
7:0	TPrescaler_Lo	Defines lower 8 bits for TPrescaler. The following formula is used to calculate fTimer if TPrescalEven bit in DemodReg is set to logic 0: $fTimer = 13.56 \text{ MHz} / (2 * TPreScaler + 1).$ Where TPreScaler = [TPrescaler_Hi:TPrescaler_Lo] (TPrescaler value on 12 bits) The following formula is used to calculate fTimer if TPrescalEven bit in DemodReg is set to logic 1: $fTimer = 13.56 \text{ MHz} / (2 * TPreScaler + 2).$ Where TPreScaler = [TPrescaler_Hi:TPrescaler_Lo] (TPrescaler value on 12 bits)

7.4.13/14 TReloadReg

Describes the 16-bit long timer reload value.

NOTE: The Reload value is split into two 8-bit registers.

Table7-88 TReloadReg (high Bit) Address: 2Ch reset value: 00h

	7	6	5	4	3	2	1	0
	TReloadVal_Hi							
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-89 TReloadReg Bit Description

Bit	Symbol	Description
7:0	TReloadVal_Hi	Defines the higher 8 bits for the TReloadReg. With a start event the timer loads the TReloadVal. Changing this register affects the timer only at the next start event.

Table7-90 TReloadReg (low Bit) Address: 2Dh reset value: 00h

	7	6	5	4	3	2	1	0
	TReloadVal_Lo							
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-91 TReloadReg Bit Description

Bit	Symbol	Description
7:0	TReloadVal_Lo	Defines the lower 8 bits for the TReloadReg. With a start event the timer loads the TReloadVal. Changing this register affects the timer only at the next start event.

7.4.15/16 TCounterValReg

Contains the current value of the timer.

NOTE: The Counter value is split into two 8-bit register.

Table7-92 TCounterValReg (highBit) Address: 2Eh reset value: xxh,

xxxxxxxh

	7	6	5	4	3	2	1	0

7.5.3 TestSel2Reg

General test signal configuration and PRBS control

Table7-100 TestSel2Reg Address: 32h reset value: 00h

	7	6	5	4	3	2	1	0
	TstBusFlip	PRBS9	PRBS15	TestBusSel				
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-101 TestSel2Reg Bit Description

Bit	Symbol	Description
7	TstBusFlip	If set to logic 1, the testbus is mapped to the parallel port by the following order: D4, D3, D2, D6, D5, D0, D1
6	PRBS9	Starts and enables the PRBS9 sequence according ITU-TO150. NOTE: All relevant registers to transmit data have to be configured before entering PRBS9 mode. The data transmission of the defined sequence is started by the send command.
5	PRBS15	Starts and enables the PRBS15 sequence according ITU-TO150. NOTE: All relevant registers to transmit data have to be configured before entering PRBS15 mode. The data transmission of the defined sequence is started by the send command.
4:0	TstBusSel	Selects the testbus.

7.5.4 TestPinEnReg

Enables the pin output driver on the 8-bit parallel bus.

Table7-102 TestPinEnReg Address: 33h reset value: 80h

	7	6	5	4	3	2	1	0
	RS232LineEn	TestPinEn						
Access	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Table7-103 TestPinEnReg Bit Description

Bit	Symbol	Description
7	RS232LineEn	Set to logic 0, the lines MX and DTRQ for the serial UART are disabled.
6:0	TestPinEn	Enables the pin output driver on the 8-bit parallel interface. Example: Setting bit 0 to 1 enables D0 Setting bit 5 to 1 enables D5 NOTE: Only valid if one of serial interfaces is used. If the SPI interface is used only D0 to D4 can be used. If the serial UART interface is used and RS232LineEn is set to logic 1 only D0 to D4 can be used.

7.5.5 TestPinValueReg

Defines the values for the 7-bit parallel port when it is used as I/O.

Table7-104 TestPinValueReg Address: 34h reset value: 00h

	7	6	5	4	3	2	1	0

8.Digital interfaces

8.1 Automatic microcontroller interface detection

The Si522A supports direct interfacing of hosts using SPI, I2C-bus or serial UART interfaces. The Si522A resets its interface and checks the current host interface type automatically after performing a power-on or hard reset. The Si522A identifies the host interface by sensing the logic levels on the control pins after the reset phase. This is done using a combination of fixed pin connections. Table 8-1 shows the different connection configurations.

Table8-1 Connection protocol for detecting different interface types

Pin	Interface type		
	UART (input)	SPI (output)	I2C (input/output)
SDA	RX	NSS	SDA
I ² C	0	0	1
EA	0	1	EA
D7	TX	MISO	SCL
D6	MX	MOSI	ADR_0
D5	DTRQ	SCK	ADR_1
D4	-	-	ADR_2
D3	-	-	ADR_3
D2	-	-	ADR_4
D1	-	-	ADR_5

8.2 SPI

A serial peripheral interface (SPI compatible) is supported to enable high-speed communication to the host. The interface can handle data speeds up to 10 Mbit/s. When communicating with a host, the Si522A acts as a slave, receiving data from the external host for register settings, sending and receiving data relevant for RF interface communication.

An interface compatible with SPI enables high-speed serial communication between the Si522A and a microcontroller. The implemented interface is in accordance with the SPI standard.

Figure 8.1 SPI connection to host

The Si522A acts as a slave during SPI communication. The SPI clock signal SCK must be generated by the master. Data communication from the master to the slave uses the MOSI line. The MISO line is used to send data from the Si522A to the master.

Data bytes on both MOSI and MISO lines are sent with the MSB first. Data on both MOSI and MISO lines must be stable on the rising edge of the clock and can be changed on the falling edge. Data is provided by the Si522A on the falling clock edge and is stable during the rising clock edge.

8.2.1 SPI read data

Reading data using SPI requires the byte order shown in Table 8-2 to be used. It is possible to read out up to n-data bytes. The first byte sent defines both the mode and the address.

Table8-2 MOSI and MISO byte order

Line	Byte0	Byte1	Byte2	...	Byte n	Byte n+1
MOSI	Address 0	Address 1	Address 2	...	Address n	00
MISO	X*	data0	data1	...	data n-1	data n

NOTE: X = Do not care. The MSB must be sent first.

8.2.2 SPI write data

To write data to the Si522A using SPI requires the byte order shown in Table 8-3. It is possible to write up to n data bytes by only sending one address byte. The first send byte defines both the mode and the address byte.

Table8-3 MOSI and MISOByte order

Line	Byte0	Byte1	Byte2	...	Byte n	Byte n+1
MOSI	Address 0	data 0	data 1	...	data n-1	data n
MISO	X*	X*	X*	...	X*	X*

NOTE: X = Do not care. The MSB must be sent first.

8.2.3 SPI address byte

The address byte has to meet the following format.

Table8-4 Address byte0 register;MOSI

7 (MSB)	6: 1	0 (LSB)
1=read/0=write	Address	0

The MSB of the first byte defines the mode used. To read data from the Si522A the MSB is set to logic 1. To write data to the Si522A the MSB must be set to logic 0. Bits 6 to 1 define the address and the LSB is set to logic 0.

8.3 UART

8.3.1 Connection to a host

Figure 8.2 UART connection to microcontrollers

NOTE: Signals DTRQ and MX can be disabled by clearing TestPinEnReg register's RS232LineEn bit.

8.3.2 Selectable UART transfer speeds

The internal UART interface is compatible with an RS232 serial interface.

The default transfer speed is 8.6 kBd. To change the transfer speed, the host controller must write a value for the new transfer speed to the SerialSpeedReg register. Bits BR_T0[2:0] and BR_T1[4:0] define the factors for setting the transfer speed in the SerialSpeedReg register. The BR_T0[2:0] and BR_T1[4:0] settings are described in Table 8-5.

Table8-5 BR_T0 and BR_T1 settings

BR_Tn	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7
BR_T0	1	1	2	4	8	16	32	64
BR_T1	1-32	33-64	33-64	33-64	33-64	33-64	33-64	33-64

Examples of different transfer speeds and the relevant register settings are given in Table 8-6.

Table8-6 Selectable UART transfer speeds

Transfer speed (kBd)	SerialSpeedReg value		Transfer speed accuracy (%) *
	Decimal	Hexadecimal	
7.2	250	FAh	:0.25
8.6	235	EBh	0.32
14.4	218	DAh	:0.25
19.2	203	CBh	0.32
38.4	171	ABh	0.32
57.6	154	9Ah	:0.25
115.2	122	7Ah	:0.25
128	116	74h	:0.06
230.4	90	5Ah	:0.25
460.8	58	3Ah	:0.25
921.6	28	1Ch	1.45
1228.8	21	15h	0.32

NOTE: The resulting transfer speed error is less than 1.5 % for all described transfer speeds

The selectable transfer speeds shown in Table 6-6 are calculated according to the following equations:

When $BR_T0[2:0]=0$:

$$transferspeed = \frac{27.12 \times 10^6}{(BR_T0 + 1)}$$

When $BR_T0[2:0]>0$:

$$transferspeed = \frac{27.12 \times 10^6}{\frac{(BR_T1 + 33)}{2^{(BR_T0-1)}}}$$

8.3.3 UART framing

Table8-7 UART framing

Bit	Length	Value
Start	1bit	0
Data	8bits	data
Stop	1bit	1

NOTE: The LSB for data and address bytes must be sent first. No parity bit is used during transmission.

Read data: To read data using the UART interface, the flow shown in Table 8-8 must be used. The first byte sent defines both the mode and the address.

Table8-8 Read data byte order

Pin	Byte 0	Byte 1
RX	address	-
TX	-	Data 0

Figure 8.3 UART read data timing diagram

Write data: To write data to the Si522A using the UART interface, the structure shown in Table 8-9 must be used.

The first byte sent defines both the mode and the address.

Table8-9 Write data byte order

Pin	Byte0	Byte1
RX	Address0	data0
TX	-	Address0

Figure 8.4 UART write data timing diagram

NOTE: The data byte can be sent directly after the address byte on pin RX.

Address byte: The address byte has to meet the following format:

The MSB of the first byte sets the mode used. To read data from the Si522A, the MSB is set to logic 1. To write data to the Si522A the MSB is set to logic 0. Bit 6 is reserved for future use, and bits 5 to 0 define the address.

Table8-10 Address byte0 register ; MOSI

7 (MSB)	6	5: 1	0 (LSB)
1 = read	reserved	address	
0 = write			

8.4 I2C

An I2C-bus (Inter-IC) interface is supported to enable a low-cost, low pin count serial bus interface to the host. The I2C-bus interface is implemented according to I2C-bus interface specification, rev. 2.1, January 2000. The interface can only act in Slave mode. Therefore the Si522A does not implement clock generation or access arbitration.

Figure 8.5 I2C-bus interface

The Si522A can act either as a slave receiver or slave transmitter in Standard mode, Fast mode and High-speed mode.

SDA is a bidirectional line connected to a positive supply voltage using a current source or a pull-up resistor. Both SDA and SCL lines are set HIGH when data is not transmitted. The Si522A has a 3-state output stage to perform the wired-AND function. Data on the I2C-bus can be transferred at data rates of up to 100 kBd in Standard mode, up to 400 kBd in Fast mode or up to 3.4 Mbit/s in High-speed mode.

If the I2C-bus interface is selected, spike suppression is activated on lines SCL and SDA as defined in the I2C-bus interface specification.

8.4.1 Data validity

Data on the SDA line must be stable during the HIGH clock period. The HIGH or LOW state of the data line must only change when the clock signal on SCL is LOW.

Figure 8.6 Bit transfer on the I2C-bus

8.4.2 START and STOP conditions

To manage the data transfer on the I2C-bus, unique START (S) and STOP (P) conditions are defined.

(1) A START condition is defined with a HIGH-to-LOW transition on the SDA line while SCL is HIGH.

(2) A STOP condition is defined with a LOW-to-HIGH transition on the SDA line while SCL is HIGH.

The I2C-bus master always generates the START and STOP conditions. The bus is busy after the START condition. The bus is free again a certain time after the STOP condition.

The bus stays busy if a repeated START (Sr) is generated instead of a STOP condition. The START (S) and repeated START (Sr) conditions are functionally identical. Therefore, S is used as a generic term to represent both the START (S) and repeated START (Sr) conditions.

Figure 8.7 START and STOP conditions

8.4.3 Byte format

Each byte must be followed by an acknowledge bit. Data is transferred with the MSB first. The number of transmitted bytes during one data transfer is unrestricted but must meet the read/write cycle format.

8.4.4 Acknowledge

An acknowledge must be sent at the end of one data byte. The acknowledge-related

clock pulse is generated by the master. The transmitter of data, either master or slave, releases the SDA line (HIGH) during the acknowledge clock pulse. The receiver pulls down the SDA line during the acknowledge clock pulse so that it remains stable LOW during the HIGH period of this clock pulse.

The master can then generate either a STOP (P) condition to stop the transfer or a repeated START (Sr) condition to start a new transfer.

A master-receiver indicates the end of data to the slave-transmitter by not generating an acknowledge on the last byte that was clocked out by the slave. The slave-transmitter releases the data line to allow the master to generate a STOP (P) or repeated START (Sr) condition.

Figure 8.8 Acknowledge on the I2C-bus

Figure 8.9 Data transfer on the I2C-bus

8.4.5 7-Bit addressing

During the I2C-bus address procedure, the first byte after the START condition is

used to determine which slave will be selected by the master.

Several address numbers are reserved. During device configuration, the designer must ensure that collisions with these reserved addresses cannot occur. Check the I2C-bus specification for a complete list of reserved addresses.

The I2C-bus address specification is dependent on the definition of pin EA. Immediately after releasing pin NRSTPD or after a power-on reset, the device defines the I2C-bus address according to pin EA.

If pin EA is set LOW, the upper 4 bits of the device bus address are reserved and set to 0101b for all Si522A devices. The remaining 3 bits (ADR_0, ADR_1, ADR_2) of the slave address can be freely configured by the customer to prevent collisions with other I2C-bus devices.

If pin EA is set HIGH, ADR_0 to ADR_5 can be completely specified at the external pins ADR_6 is always set to logic 0.

In both modes, the external address coding is latched immediately after releasing the reset condition. Further changes at the used pins are not taken into consideration.

Depending on the external wiring, the I2C-bus address pins can be used for test signal outputs.

Figure 8.10 First byte following the START procedure

8.4.6 Register write access

To write data from the host controller using the I2C-bus to a specific register in the Si522A the following frame format must be used.

- The first byte of a frame indicates the device address according to the I2C-bus rules.
- The second byte indicates the register address followed by up to n-data bytes.

In one frame all data bytes are written to the same register address. This enables fast FIFO buffer access. The Read/Write ($\overline{R/W}$) bit is set to logic 0.

8.4.7 Register read access

To read out data from a specific register address in the Si522A, the host controller must use the following procedure:

- Firstly, a write access to the specific register address must be performed as indicated in the frame that follows
- The first byte of a frame indicates the device address according to the I2C-bus rules
- The second byte indicates the register address. No data bytes are added
- The Read/Write bit is 0

After the write access, read access can start. The host sends the device address of the Si522A. In response, the Si522A sends the content of the read access register. In one frame all data bytes can be read from the same register address. This enables fast FIFO buffer access or register polling.

Figure 8.11 Register read and write access

8.4.8 High-speed mode

In High-speed mode (HS mode), the device can transfer information at data rates of up to 3.4 Mbit/s, while remaining fully downward-compatible with Fast or Standard mode (F/S mode) for bidirectional communication in a mixed-speed bus system.

8.4.9 High-speed transfer

To achieve data rates of up to 3.4 Mbit/s the following improvements have been made to I²C-bus operation.

- The inputs of the device in HS mode incorporate spike suppression, a Schmitt trigger on the SDA and SCL inputs and different timing constants when compared to F/S mode.
- The output buffers of the device in HS mode incorporate slope control of the falling edges of the SDA and SCL signals with different fall times compared to F/S mode.

8.4.10 Serial data transfer format in HS mode

The HS mode serial data transfer format meets the Standard mode I²C-bus specification. HS mode can only start after all of the following conditions (all of which are in F/S mode):

- (1) START condition (S)
- (2) 8-bit master code (00001XXXb)
- (3) Not-acknowledge bit ($\bar{A}$)

When HS mode starts, the active master sends a repeated START condition (Sr) followed by a 7-bit slave address with a R/W bit address and receives an acknowledge bit (A) from the selected Si522A.

Data transfer continues in HS mode after the next repeated START (Sr), only switching back to F/S mode after a STOP condition (P). To reduce the overhead of the master code, a master links a number of HS mode transfers, separated by repeated START conditions (Sr).

Figure 8.12 I2C-bus HS mode protocol switch

Figure 8.13 I2C-bus HS mode protocol frame

8.4.11 Switching between F/S mode and HS mode

After reset and initialization, the Si522A is in Fast mode (which is in effect F/S mode as Fast mode is downward-compatible with Standard mode). The connected Si522A recognizes the “S 00001XXX A” sequence and switches its internal circuitry from the Fast mode setting to the HS mode setting.

The following actions are taken:

1. Adapt the SDA and SCL input filters according to the spike suppression requirement in HS mode.

2. Adapt the slope control of the SDA output stages.

It is possible for system configurations that do not have other I2C-bus devices involved in the communication to switch to HS mode permanently. This is implemented by setting Status2Reg register's I2CForceHS bit to logic 1. In permanent HS mode, the master code is not required to be sent. This is not defined in the specification and must only be used when no other devices are connected on the bus. In addition, spikes on the I2C-bus lines must be avoided because of the reduced spike suppression.

8.4.12 Si522A at F/S mode

Si522A is fully downward-compatible and can be connected to an F/S mode I2C-bus system. The device stays in F/S mode and communicates at F/S mode speeds because a master code is not transmitted in this configuration.

9. UART analog interface and contactless UART

9.1 General

The integrated contactless UART supports the external host online with framing and error checking of the protocol requirements up to 848 k Bd. An external circuit can be connected to the communication interface pins MFIN and MFOUT to modulate and demodulate the data.

The contactless UART handles the protocol requirements for the communication protocols in cooperation with the host. Protocol handling generates bit and byte-oriented framing. In addition, it handles error detection such as parity and CRC, based on the various supported contactless communication protocols.

NOTE: The size and tuning of the antenna and the power supply voltage have an important impact on the achievable operating distance.

9.2 TX driver

The signal on pins TX1 and TX2 is the 13.56 MHz energy carrier modulated by an envelope signal. It can be used to drive an antenna directly using a few passive components for matching and filtering. The signal on pins TX1 and TX2 can be configured using the TxControlReg register.

The modulation index can be set by adjusting the impedance of the drivers. The impedance of the p-driver can be configured using registers CWGsPReg and ModGsPReg. The impedance of the n-driver can be configured using the GsNReg register. The modulation index also depends on the antenna design and tuning.

The TxModeReg and TxSelReg registers control the data rate and framing during transmission and the antenna driver setting to support the different requirements at the different modes and transfer speeds.

Table9-1 Register and bit settings controlling the signal on pin TX1

Tx1RFEn Bit	Force 100ASK Bit	InvTx1RF OnBit	InvTx1RF OffBit	Envelope	TX1 pin	GSPMos	GSNMos	Note

			1	X*	0	0	pMod	nMod	
					1	RF_n	pCW	nCW	
		1	0	X*	X*	RF	pCW	nCW	
			1	X*	X*	RF_n	pCW	nCW	

X = Do not care*

The following abbreviations have been used in Table 10-1 and Table 10-2:

(1) RF: 13.56 MHz clock derived from 27.12 MHz quartz crystal oscillator divided by 2

(2) RF_n: inverted 13.56 MHz clock

(3) GSPMos: conductance, configuration of the PMOS array

(4) GSNMos: conductance, configuration of the NMOS array

(5) pCW: PMOS conductance value for continuous wave defined by the CWGsPReg register

(6) pMod: PMOS conductance value for modulation defined by the ModGsPReg register

(7) nCW: NMOS conductance value for continuous wave defined by the GsNReg register's CWGsN[3:0] bits

(8) nMod: NMOS conductance value for modulation defined by the GsNReg register's ModGsN[3:0] bits

(9) X = do not care.

NOTE: If only one driver is switched on, the values for CWGsPReg, ModGsPReg and GsNReg registers are used for both drivers

9.3 Serial data switch

Two main blocks are implemented in the Si522A. The digital block comprises the state machines, encoder/decoder logic. The analog block comprises the modulator and antenna drivers, the receiver and amplifiers. The interface between these two blocks can be configured in the way, that the interfacing signals may be routed to the pins

MFIN and MFOUT. This topology allows the analog block of the Si522A to be connected to the digital block of another device.

The serial signal switch is controlled by the TxSelReg and RxSelReg registers.

Figure 9.1 shows the serial data switch for TX1 and TX2.

Figure 9.1 Serial data switch for TX1 and TX2

9.4 CRC coprocessor

The following CRC coprocessor parameters can be configured:

- The CRC preset value can be either 0000h, 6363h, A671h or FFFFh depending on the ModeReg register's CRCPreset[1:0] bits setting
- The CRC polynomial for the 16-bit CRC is fixed to $x^{16}+x^{12}+x^5+1$
- The CRCResultReg register indicates the result of the CRC calculation. This register is split into two 8-bit registers representing the higher and lower bytes.
- The ModeReg register's MSBFirst bit indicates that data will be loaded with the MSB first.

Table9-4 CRC coprocessor parameters

Parameter	Value
CRC register length	16 bit
CRC algorithm	algorithm according to ISO/IEC 14443 A and ITU-T
CRC preset value	0000h, 6363h, A671h or FFFFh depending on the setting of the ModeReg register's CRCPreset[1:0] bits

10. FIFO

An 8×64 bit FIFO buffer is used in the Si522A. It buffers the input and output data stream between the host and the Si522A's internal state machine. This makes it possible to manage data streams up to 64 bytes long without the need to take timing constraints into account.

10.1 Accessing the FIFO buffer

The FIFO buffer input and output data bus is connected to the FIFODataReg register. Writing to this register stores one byte in the FIFO buffer and increments the internal FIFO buffer write pointer. Reading from this register shows the FIFO buffer contents stored in the FIFO buffer read pointer and decrements the FIFO buffer read pointer. The distance between the write and read pointer can be obtained by reading the FIFOLevelReg register.

When the microcontroller starts a command, the Si522A can access the FIFO buffer according to that command, while the command is in progress. Only one FIFO buffer has been implemented which can be used for input and output. The microcontroller must ensure that there are not any unintentional FIFO buffer accesses.

10.2 Controlling the FIFO buffer

The FIFO buffer pointers can be reset by setting FIFOLevelReg register's FlushBuffer bit to logic 1. Consequently, the FIFOLevel[6:0] bits are all set to logic 0 and the ErrorReg register's BufferOvfl bit is cleared. The bytes stored in the FIFO buffer are no longer accessible allowing the FIFO buffer to be filled with another 64 bytes.

10.3 FIFO buffer status information

The host can get the following FIFO buffer status information:

- Number of bytes stored in the FIFO buffer: FIFOLevelReg register's FIFOLevel[6:0]
- FIFO buffer almost full warning: Status1Reg register's HiAlert bit

- FIFO buffer almost empty warning: Status1Reg register's LoAlert bit
- FIFO buffer overflow warning: ErrorReg register's BufferOvfl bit. The BufferOvfl bit can only be cleared by setting the FIFOLevelReg register's FlushBuffer bit.

The Si522A can generate an interrupt signal when:

- CommIEnReg register's LoAlertIEn bit is set to logic 1. It activates pin IRQ when Status1Reg register's LoAlert bit changes to logic 1.
- CommIEnReg register's HiAlertIEn bit is set to logic 1. It activates pin IRQ when Status1Reg register's HiAlert bit changes to logic 1.

If the maximum number of WaterLevel bytes (as set in the WaterLevelReg register) or less are stored in the FIFO buffer, the HiAlert bit is set to logic 1.

$$HiAlert = (64 - FIFOLength) \leq WaterLevel$$

If the number of WaterLevel bytes (as set in the WaterLevelReg register) or less are stored in the FIFO buffer, the LoAlert bit is set to logic 1.

$$LoAlert = FIFOLength \leq WaterLevel$$

11. Interrupt request system

The Si522A indicates certain events by setting the Status1Reg register's IRq bit and, if activated, by pin IRQ. The signal on pin IRQ can be used to interrupt the host using its interrupt handling capabilities. This allows the implementation of efficient host software.

11.1 Interrupt sources overview

Table 11-1 shows the available interrupt bits, the corresponding source and the condition for its activation. The CommIrqReg register's TimerIRq interrupt bit indicates an interrupt set by the timer unit which is set when the timer decrements from 1 to 0.

The CommIrqReg register's TxIRq bit indicates that the transmitter has finished. If the state changes from sending data to transmitting the end of the frame pattern, the transmitter unit automatically sets the interrupt bit. The CRC coprocessor sets the DivIrqReg register's CRCIRq bit after processing all the FIFO buffer data which is indicated by CRCReady bit = 1.

The CommIrqReg register's RxIRq bit indicates an interrupt when the end of the received data is detected. The CommIrqReg register's IdleIRq bit is set if a command finishes and the Command[3:0] value in the CommandReg register changes to idle.

The CommIrqReg register's HiAlertIRq bit is set to logic 1 when the Status1Reg register's HiAlert bit is set to logic 1 which means that the FIFO buffer has reached the level indicated by the WaterLevel[5:0] bits.

The CommIrqReg register's LoAlertIRq bit is set to logic 1 when the Status1Reg register's LoAlert bit is set to logic 1 which means that the FIFO buffer has reached the level indicated by the WaterLevel[5:0] bits.

The CommIrqReg register's ErrIRq bit indicates an error detected by the contactless UART during send or receive. This is indicated when any bit is set to logic 1 in register ErrorReg.

Table11-1 Interrupt sources

Interrupt flag	Interrupt source	Trigger action
TimerIRq	Timer unit	the timer counts from 1 to 0

TxIRq	Transmitter	a transmitted data stream ends
CRCIRq	CRC coprocessor	all data from the FIFO buffer has been processed
RxIRq	Receiver	a received data stream ends
IdleIRq	CommIRqReg	command execution finishes
HiAlertIRq	FIFO	the FIFO buffer is almost full
LoAlertIRq	FIFO	the FIFO buffer is almost empty
ErrIRq	Contactless UART	an error is detected
CardIRq	ACD	card detected
RFExIRq	ACD	detected other 13.56 Mhz RF signal
RFlowIRq	ACD	sent RF too low
OscMonIRq	OSC monitoring	OSC four consecutive vibration failures
WdtIRq	Watchdog	watchdog timer reaches the set time

12. Timer unit

A timer unit is implemented in the Si522A. The external host controller may use this timer to manage timing relevant tasks. The timer unit may be used in one of the following configurations:

- Time-out counter
- Watch-dog counter
- Stop watch
- Programmable one-shot
- Periodical trigger

The timer unit can be used to measure the time interval between two events or to indicate that a specific event occurred after a specific time. The timer can be triggered by events which will be explained in the following, but the timer itself does not influence any internal event (e.g. A time-out during data reception does not influence the reception process automatically). Furthermore, several timer related bits are set and these bits can be used to generate an interrupt.

The timer has an input clock of 13.56 MHz (derived from the 27.12 MHz quartz). The timer consists of two stages: prescaler and counter. The prescaler is a 12-bit counter. The reload value for TPrescaler can be defined between 0 and 4095 in register TModeReg and TPrescalerReg. The reload value for the counter is defined by 16 bits in a range of 0 to 65535 in the register TReloadReg.

If the counter reaches 0 an interrupt will be generated automatically indicated by setting the TimerIRQ bit in the register CommIRQReg. If enabled, this event can be indicated on the IRQ line. The bit TimerIRQ can be set and reset by the host controller. Depending on the configuration the timer will stop at 0 or restart with the value from register TReloadReg.

The status of the timer is indicated by bit TRunning in register Status1Reg.

The timer can be manually started by TStartNow in register ControlReg or manually stopped by TStopNow in register ControlReg.

Furthermore the timer can be activated automatically by setting the bit TAuto in the register TModeReg to fulfill dedicated protocol requirements automatically

The time delay of a timer stage is the reload value +1.

The definition of total time is: $t = (TPrescaler * 2 + 1) * (TRload + 1) / 13.56 \text{ MHz}$

If TPrescaleEven bit is set: $t = (TPrescaler * 2 + 2) * (TRload + 1) / 13.56 \text{ MHz}$.

Configuration when maximum time: $TPrescaler = 4095$, $TReloadVal = 65535$;

Maximum time: $(2*4095+2)*65536/13.56MHz = 39.59s$

Example:

To indicate 25 us it is required to count 339 clock cycles. This means the value for $TPrescaler$ has to be set to $TPrescaler = 169$. The timer has now an input clock of 25 us. The timer can count up to 65535 timeslots of each 25 μs .

13. Power reduction modes

13.1 Hard power-down

Hard power-down is enabled when pin NRSTPD is LOW. This turns off all internal current sinks including the oscillator. All digital input buffers are separated from the input pins and clamped internally (except pin NRSTPD). The output pins are frozen at either a HIGH or LOW level.

13.2 Soft power-down mode

Soft Power-down mode is entered immediately after the CommandReg register's PowerDown bit is set to logic 1. All internal current sinks are switched off, including the oscillator buffer. However, the digital input buffers are not separated from the input pins and keep their functionality. The digital output pins do not change their state.

During soft power-down, all register values, the FIFO buffer content and the configuration keep their current contents.

After setting the PowerDown bit to logic 0, it takes 1024 clocks until the Soft power-down mode is exited indicated by the PowerDown bit. Setting it to logic 0 does not immediately clear it. It is cleared automatically by the Si522A when Soft power-down mode is exited.

NOTE: If the internal oscillator is used, you must take into account that it is supplied by pin AVDD and it will take a certain time (t_{osc}) until the oscillator is stable and the clock cycles can be detected by the internal logic. It is recommended for the serial UART, to first send the value 55h to the Si522A. The oscillator must be stable for further access to the registers. To ensure this, perform a read access to address 0 until the Si522A answers to the last read command with the register content of address 0. This indicates that the Si522A is ready.

13.3 Transmitter power-down mode

The Transmitter Power-down mode switches off the internal antenna drivers

thereby, turning off the RF field. Transmitter power-down mode is entered by setting either the TxControlReg register's Tx1RFEn bit or Tx2RFEn bit to logic 0.

14. Oscillator circuitry

Figure 14.1 Quartz crystal connection

The clock applied to the Si522A provides a time basis for the synchronous system's encoder and decoder. The stability of the clock frequency, therefore, is an important factor for correct operation. To obtain optimum performance, clock jitter must be reduced as much as possible. This is best achieved using the internal oscillator buffer with the recommended circuitry.

If an external clock source is used, the clock signal must be applied to pin OSCIN. In this case, special care must be taken with the clock duty cycle and clock jitter and the clock quality must be verified.

15. Reset and oscillator start-up time

15.1 Reset timing requirements

The reset signal is filtered by a hysteresis circuit and a spike filter before it enters the digital circuit. The spike filter rejects signals shorter than 10 ns. In order to perform a reset, the signal must be LOW for at least 100 ns.

15.2 Oscillator start-up time

If the Si522A has been set to a Power-down mode or is powered by a VDD supply, the start-up time for the Si522A depends on the oscillator used and is shown in Figure 15.1

Figure 15.1 Oscillator start-up time

The time ($t_{startup}$) is the start-up time of the crystal oscillator circuit. The crystal oscillator start-up time is defined by the crystal.

The time (t_d) is the internal delay time of the Si522A when the clock signal is stable before the Si522A can be addressed.

The delay time is calculated by:

$$t_d = \frac{1024}{27 \mu s} = 37.74 \mu s$$

The time (t_{osc}) is the sum of t_d and $t_{startup}$.

16. Command set

The Si522A operation is determined by a state machine capable of performing a set of commands. A command is executed by writing a command code to the CommandReg register.

Arguments and/or data necessary to process a command are exchanged via the FIFO buffer.

16.1 General description

Every command needed to be input as data flow will handle the data in FIFO immediately, except Transceive command. To use this command, bit StartSend in BitFramingReg should open data transmission.

Every command needs related parameters. The command is executed only when FIFO gets correct parameters.

When command starts to be excuted, it will not clear FIFO, which means it can write command parameters into FIFO first, then execute the command.

It can interrupt current executed command by writing a new command code to CommandReg.

16.2 Command overview

Table16-1 command overview

Command	Command code	Description
Idle	0000	no action, cancels current command execution
Generate RandomID	0010	IDgenerates a 10-byte random ID number
CalcCRC	0011	activates the CRC coprocessor or performs a self test
Transmit	0100	transmits data from the FIFO buffer
MStart	0101	Trigger 3K RC automatic correction
ADC_EXCUTE	0110	Automatically obtain Poll reference values
NoCmd Change	0111	no command change, can be used to modify the CommandReg register bits without affecting the command, for example, the PowerDown bit

Receive	1000	activates the receiver circuits
Transceive	1100	transmits data from FIFO buffer to antenna and automatically activates the receiver after transmission
SoftReset	1111	resets the Si522A

16.3 Command descriptions

16.3.1 Idle

Places the Si522A in Idle mode. The Idle command also terminates itself.

16.3.2 Generate RandomID

This command generates a 10-byte random number which is initially stored in the internal buffer. This then overwrites the 10 bytes in the internal 25-byte buffer. This command automatically terminates when finished and the Si522A returns to Idle mode.

16.3.3 CalcCRC

The FIFO buffer content is transferred to the CRC coprocessor and the CRC calculation is started. The calculation result is stored in the CRCResultReg register. The CRC calculation is not limited to a dedicated number of bytes. The calculation is not stopped when the FIFO buffer is empty during the data stream. The next byte written to the FIFO buffer is added to the calculation.

The CRC preset value is controlled by the ModeReg register's CRCPreset[1:0] bits. The value is loaded in to the CRC coprocessor when the command starts.

This command must be terminated by writing a command to the CommandReg register, such as, the Idle command.

If the AutoTestReg register's SelfTest[3:0] bits are set correctly, the Si522A enters Self Test mode. Starting the CalcCRC command initiates a digital self test. The result of the self test is written to the FIFO buffer.

16.3.4 Transmit

The FIFO buffer content is immediately transmitted after starting this command. Before transmitting the FIFO buffer content, all relevant registers must be set for data transmission.

This command automatically terminates when the FIFO buffer is empty. It can be terminated by another command written to the CommandReg register.

16.3.5 MStart

Correct 3K RC automatically ,when Max is set to 0, only coarse calibration; when set to 1, first coarse calibration followed by fine calibration.

16.3.6 ADC_EXCUTE

Automatically start ADC for RF measurement.

16.3.7 NoCmdChange

This command does not influence any running command in the CommandReg register. It can be used to manipulate any bit except the CommandReg register Command[3:0] bits, for example, the RcvOff bit or the PowerDown bit.

16.3.8 Receive

The Si522A activates the receiver path and waits for a data stream to be received. The correct settings must be chosen before starting this command.

This command automatically terminates when the data stream ends. This is indicated either by the end of frame pattern or by the length byte depending on the selected frame type and speed.

NOTE: If the RxModeReg register's RxMultiple bit is set to logic 1, the Receive command will not automatically terminate. It must be terminated by starting another command in the CommandReg register.

16.3.9 Transceive

This command continuously repeats the transmission of data from the FIFO buffer and the reception of data from the RF field. The first action is transmit and after transmission the command is changed to receive a data stream.

Each transmit process must be started by setting the BitFramingReg register's StartSend bit to logic 1. This command must be cleared by writing any command to the CommandReg register.

NOTE: If the RxModeReg register's RxMultiple bit is set to logic 1, the Transceive command never leaves the receive state because this state cannot be cancelled automatically.

16.3.10 SoftReset

This command performs a reset of the device. The configuration data of the internal buffer remains unchanged. All registers are set to the reset values. This command automatically terminates when finished.

NOTE: The SerialSpeedReg register is reset and therefore the serial data rate is set to 9.6 kBd.

17. Application information

The Figure below shows a typical circuit diagram, using a complementary antenna connection to the Si522A.

Figure 17.1 Si522A typical application diagram

18. Recommended operating conditions

The limit parameters and recommended working environment are shown in the table below:

Table18-1 limit parameter

Parameter	Symbol	Min	Max	Unit
Supply voltage	VDD	2.3	4	V
Temperature	Tamb	-40	+110	°C

Table18-2 recommend working environment

Parameter	Symbol	Conditions	Min	Typical	Max	Unit
Analog supply voltage	VDDA	AVDD=VDD(PVDD)=VDD(TVDD); VSSA=VSSD=VSS(PVSS)=VSS(TVSS)=0V	2.3	3.3	3.6	V
TVDD supply voltage	VDD(TVDD)		2.3	3.3	3.6	V
PVDD supply voltage	VDD(PVDD)		2.3	3.3	3.6	V
SVDD supply voltage	VDD(SVDD)	VSSA=VSSD=VSS(PVSS)=VSS(TVSS)=0V	2.3	3.3	3.6	V
Temperature	Tamb	QFN32	-40	-	+110	°C

19.Package information

Package specifications:

Figure 19.1 Si522A package outline

Parameter (unit: mm) :

Table19-1 typical specifications

Symbol	Min	Typical	Max
A	0.70	0.75	0.80
A1	0	0.02	0.05
A3	0.20REF		
b	0.23	0.25	0.28
D	4.90	5.00	5.10
E	4.90	5.00	5.10
D2	3.35	3.50	3.65
E2	3.35	3.50	3.65
e	0.48	0.50	0.53
K	0.20	-	-
L	0.35	0.40	0.45
R	0.09	-	-
