11 November 2024

In relation with the list of communications equipment and services (Covered List) that have been determined to pose an unacceptable risk to the national security of the United States or the security and safety of United States persons, and with particular reference to software released by Kaspersky or any of its predecessors, successors, parents, subsidiaries, or affiliates,

—  
We declare

that in our R-Safe RFID safety sensor, the above mentioned Kaspersky software can't be installed in our device because these devices have a limited capacity (memory) that can't permit the installation of this software. As a matter of fact our devices use an microcontroller of the family MKE manufactured by NXP semiconductors. These microcontroller have an architecture with these embedded memories: 32kbyte reserved for programming (flash memory), 256 byte EEPROM and 4kbyte RAM. These memories are incompatible with the installation of Kaspersky software which need a greater reserved memory (more than 1Gbyte).
