Introduction:

Boxing is a combat sport in which two opponents of equal size and ability cover their fists with gloves. Fighting each other, it is both an amateur and a professional sport. In boxing, boxing targets are usually used to train the speed and strength of the players during boxing training. Since the opponent's gap in boxing matches is so short, speed is more important than strength training. Hand offensive and defensive reflexes, the product uses electronically controlled light guidance to train people's ability to respond by sound signals to accurately hit the target point, thus efficiently forging one's overall coordination and sensitivity.
