4.1 Identification

Manufacturer name and address	Gilgen Doors Systems AG Freiburgstrasse 34 3150 Schwarzenburg SWITZERLAND
Name and address of factory (ies)	Gilgen Doors Systems AG Freiburgstrasse 34 3150 Schwarzenburg SWITZERLAND
Production country	Switzerland
Trade mark	Gilgen Door Systems
Test item description	Door operator
Use description	The Gilgen Control Panel enables to set the operating mode of the door. A second control level enables the access to the most common additional functions. Gilgen Control Panel communicates via Bluetooth with a Smartphone or with Gilgen Connect Mobile (app). Full access to all door parameters is possible via the app.
Model/Type reference	Control Panel + 45-0725-100/12 (Frontend black) 45-0725-100/11 (Frontend white)
FCC ID	2BLJF-CONNECTCP
Serial no	072510011.24030001 EUT has no S/N (prototype). Marking Gilgen: RADIO #1: Used for Radiated Emission tests RADIO #2: Used for Conducted Emission tests
Software version	V0.8.12d
Highest internal frequency	100 MHz
Highest radio service frequency	2480 MHz
Supply	U = 9 – 26 VDC / I = 171 mA / 500 mA / P = 4.5 W
Dimension	~ 5.5 cm x 5.5 cm x 3 cm (l x w x h)
Weight	~ 0.2 kg
EUT photos and setup	See document 23CH-00972.R02_Annex1.pdf (dated 2025-04-28), 8 pages
Technical documentation	None. The equipment is completely identified by the above-mentioned information. Gilgen Doors Systems AG assures the traceability of the documentation and is responsible for the product identification.

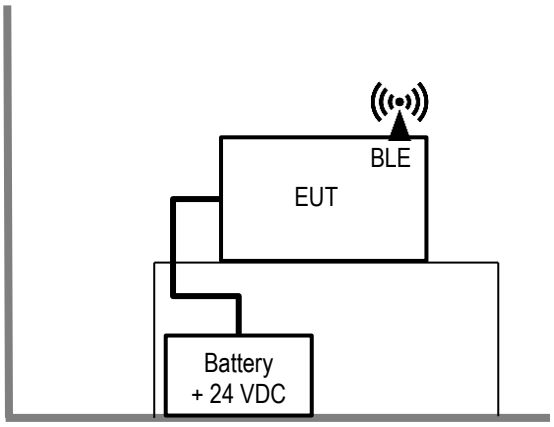
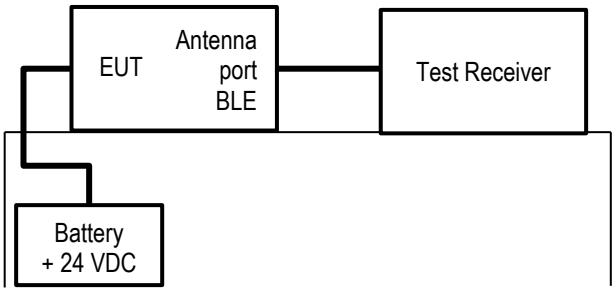
5.4 Test configuration



Test configuration – Radiated Emission



Test configuration – Conducted Emission

5.5 Operating conditions

Power supply during tests: + 24 VDC from external battery
- Continuous TX
- Duty cycle 100 %
- Max power set to 9 (0 dBm)
- GFSK Modulated Carrier with PRBS9
- Data rate 1 Mbps

5.6 Monitoring of the EUT

The performance of the EUT during the test is monitored as following:

The EUT is monitored (setup of frequency) with a software installed on a portable PC.
Software used : SmartSnippets Toolbox v5.0.24.4128

5.7 Auxiliary equipment

The following pieces of equipment are used for the monitoring of the EUT or are necessary for the EUT but they are not part of the EUT.

Product	Brand	Model No.	ID	Remark
Portable PC	DELL	Vostro 3750	H2M20Q1	Eurofins equipment Used to configure the BLE channels

5.8 General remarks

"(See Enclosure #)" refers to additional information appended to the report.
"(See appended table)" refers to a table appended to the report.

Throughout this report a ☐ comma / ☒ point is used as the decimal separator.

Compliance assessment

The statements of conformity are made on the basis of the testing standards and by applying the measurement uncertainties according to the rules in the applied standards as follows:

- Compliance is deemed to occur if no measured value exceeds the respective limit.
- Non-compliance is deemed to occur if any measured value exceeds the respective limit.

No additional margin to the limit is considered under the condition that the measurement instruments fulfil the requirements of the IECEE OD-5014 and the measurement uncertainty does not exceed the limits given in the relevant standards (e.g. U_{CISPR} as per CISPR 16-4-2, IEC 61000-4 series or product standards).

6. Test results

6.1 Minimum 6 dB bandwidth

FCC reference:	Part 15.247 (a)(2)
Test Method:	6 dB Bandwidth test was performed using a spectrum analyser in accordance with FCC KDB 558074 Section 8.2 referring ANSI C63.10 Section 11.8.1 Option 1
Limit:	Minimum 6 dB bandwidth shall be at least 500 kHz

FCC reference:	Part 15.247 (b)(3)
Test Method:	Test was performed using a spectrum analyser in accordance with FCC KDB 558074 Section 8.3.1.1 with RBW > DTS Bandwidth referring ANSI C63.10:2013 Section 11.9.1.1
Limit:	Maximum 1 Watt (= 30 dBm) for systems using antennas with directional gains that do not exceed 6 dBi. If antennas with directional gains exceeding 6 dBi are used, the maximum peak output power shall be reduced as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi

6.5 Radiated emission

6.5.1 9 kHz to 30 MHz

FCC reference: Part 15.247 (d) and Part 15.209 (a)

Test Method: FCC KDB 558074 Section 8.5 and Section 8.6 referring ANSI C63.10 Section 11.11, 11.12, 6.3 and 6.5

Measuring method: The magnetic disturbance radiated by the equipment under test is measured using a spectrum analyser and a wide band magnetic antenna. The centre of the antenna is placed at 1.3 m height, first in the direction of the apparatus under test, then at 90° to the apparatus and horizontally. The turning table is operated through 360° during the measurement. The recording is carried out considering the maximum value of the disturbance appearing during the functioning of the apparatus under test. The peak values are recorded continuously on a graph. The values exceeding the limits shall be re-measured using a measuring receiver.

6.5.2 30 MHz to 1 GHz

FCC reference: Part 15.247 (d) and Part 15.209 (a)

Test Method: FCC KDB 558074 Section 8.5 and Section 8.6 referring ANSI C63.10 Section 11.11, 11.12, 6.3 and 6.5

Measuring method: The electromagnetic disturbance radiated by the equipment is measured using a spectrum analyser and a wide band antenna. The antenna is moved from 1 to 4 m in height successively with horizontal and vertical polarisations. The turning table is operated through 360° during the measurements. The recordings are carried out taking into account the maximum value of all the disturbances appearing while the apparatus is under test. The peak values are recorded continuously on the graph. The values exceeding a limit shall be re-measured manually using a receiver.

Test Method: FCC KDB 558074 Section 8.5 and Section 8.6 referring ANSI C63.10 Section 11.11, 11.12, 6.3 and 6.5

Measuring method: The electromagnetic disturbance radiated by the equipment is measured using a spectrum analyser and a wide band antenna. The antenna is moved from 1 to 4 m in height successively with horizontal and vertical polarisations. The turning table is operated through 360° during the measurements. The recordings are carried out considering the maximum value of all the disturbances appearing while the apparatus is under test. The peak values are recorded continuously on the graph. The values exceeding a limit shall be re-measured manually using a receiver.

Remarks:	Limit values expressed in dBµV/m and transformed to a measuring distance of 1 m (factor used = 20 dB/decade) if necessary e.g.: for f = 6 GHz the limit is 500µV/m at 3 m;			

$$20\ log\left(\frac{500\frac{\mu V}{m}}{1\frac{\mu V}{m}}\right) + 20\ log\left(\frac{3m}{1m}\right) = 63.5\ \frac{dB\mu V}{m}\ at\ 1m$$

6.6 Band-edge emission (radiated)

FCC reference: Part 15.247 (d) and 15.209 (a)

Test Method: FCC KDB 558074 Section 8.7 referencing ANSI C63.10 Section 6.10.4, 6.10.5, 11.11, 11.2 and 11.13

Lower band edge within non-restricted band

Test Method: As it falls within a non-restricted band, only peak measurement is required. As the maximum peak conducted output power was previously measured, in accordance with FCC KDB 558074 Section 8.7 lower band edge measurements was performed with peak detector and the – 20 dBc limit applied.

Limit: In any 100 kHz bandwidth outside the frequency band, the radio frequency power shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

Lower band edge within restricted band

Test Method: As it falls within a restricted band, both peak and average measurement are required. A marker is placed on the highest point on each trace.

Limit: According FCC §15.209

Upper band edge

Test Method: As it falls within a restricted band, both peak and average measurement are required. A marker is placed on the highest point on each trace. Also, markers are placed at the edge of the band.

Limit: According FCC §15.209

Test summary

Test engineer:	Ms C. Clément		
Test date:	2024-06-03		
Climatic conditions:	Temperature: 22 °C	Humidity: 46 %	Pressure QFE: 937 hPa
Test site:	☒ SAC3	☐ SAC5	☐ SAC10
	☐ Laboratory	☐ Shielded room	☐ Open test site
Distance:	☐ 1 m	☒ 3 m	☐ 10 m
Position of EUT:	1.5 m (height of the equipment under test above floor)		
Test sample used:	Sample #1, see §4.3		
Operating mode:	See §5.5		
Cables connected:	DC supply		
Modifications:	None		

Spectrum Analyser:

Lower band edge within non-restricted band:

RBW: 100 kHz, VBW: 300 kHz

Detector: Peak, Trace mode: Max Hold

Sweep time: Auto, Span: 5 MHz

Measurement: Marker placed on the peak of the signal

Lower band edge in the restricted band:

RBW: 1 MHz, VBW: 3 MHz

Detector: Peak, Trace mode: Max Hold and RMS

Sweep time: Auto, Span: 8 MHz

Measurement: Markers placed on the highest point on each trace

Upper band edge in the restricted band:

RBW: 1 MHz, VBW: 3 MHz

Detector: Peak, Trace mode: Max Hold and RMS

Sweep time: Auto, Span: 5 MHz

Measurement: Markers placed on the highest point on each trace

Remarks: The EUT was transmitting continuously with duty cycle > 98 %, therefore no duty cycle correction was required.

*Calibration interval extended, based on sufficient calibration data and experience of use (see IECEE OD-5011:2019 clause 8.2.5)

8. Measurement instrumentation uncertainties

The reported uncertainty of measurement is stated as combined standard uncertainty multiplied by a coverage factor k = 2 (if not stated otherwise).

The measured value (y) and the associated expanded uncertainty (U) represent the interval (y ±U) which contains the value of the measured quantity with a probability of approximately 95 %. The uncertainty was estimated according to the standard applying on the test conducted and base also by following the guidelines of the ISO (GUM:1995).

The measurement uncertainty contains contributions originating from the standard for the measurement equipment used, from the calibration method and the standard applying to the EUT (with own dedicated chapters).

See clause 4.8 in OD 2020 and document AA-STS 41.01-09 measurement uncertainty, dated 2021-06-02 for more details.
