

Dear TÜV Rheinland team,

Please consider this letter as official declaration of the differences between the 2 model numbers we are planning to certify.

RIM\_03\_N – Infotainment control unit – P/N: 002073871-8.1 – customer Rimac – variant North America

APF\_03\_N – Infotainment control unit – P/N: 002066204-5.1 – customer Pininfarina – variant North America

The only difference: between RIM\_03\_N and APF\_03\_N, is the eSIM IC and the label of the device containing the proper model number.

All other components, the PCB layout and the mechanics are identical.

The eSIM IC is a small component that only stores the carrier information and cryptographic information for authentication in the cellular network. It does not influence the behaviour of either the hardware or software in any other way.
