## RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v06

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0 \text{ for 1-g SAR and } \leq 7.5 \text{ for 10-g extremity SAR, where}$   
 $f(\text{GHz})$  is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison

### **EDR:**

Worse case output power is as below: [2480MHz: 0.26dBm]

Maximum output power is 0.26dBm (1.06 mW).

$(1.06 \text{ mW} / 5\text{mm}) \cdot [\sqrt{2.480\text{GHz}}] = 0.33 < 3.0 \text{ for 1-g SAR}$

Then SAR evaluation is not required
