

FCC RF Exposure

EUT Description: SMART PHONE CASE

Test type.:IP16

Series model:IP16PL, IP16P, IP16PM, IP15, IP15PL, IP15P, IP15PM,IP14, IP14PL, IP14P, IP14PM,IP13,IP13P, IP13PM

FCC ID: 2BOVK-IP16

Equipment type: Portable Device

1. Test Procedure

According to KDB 447498 D01 General RF Exposure Guidance v06

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

$$\frac{[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}]}{\leq 3.0 \text{ for 1-g SAR and } \leq 7.5 \text{ for 10-g extremity SAR,}}$$

where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation The result is rounded to one decimal place for comparison

The test exclusions are applicable only when the minimum test separation distance is ≤ 50 mm and for transmission frequencies between 100 MHz and 6GHz.

When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

2. Test Result of RF Exposure Evaluation

BLE

Mode	Channel Freq. (MHz)	Maximum Conducted Output Power(PK) (dBm)	Antenna Gain (dBi)	Antenna gain numeric	Max power (W)
GFSK	2402	0.39	-0.58	0.874	0.00109395
	2440	0.24	-0.58	0.874	0.00105681
	2480	0.64	-0.58	0.874	0.00115877

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] = 1.15877 / 5 \cdot \sqrt{2.480} = 0.36496 \leq 3.0$$
 Threshold at which no SAR required is and ≤ 3.0 for 1-g SAR, Separation distance is 5mm.

Conclusion: No SAR required

NFC:

Equipment type: Portable Device

Refer to KDB 447498 D01 section 4.3 (c) and Annex C

c) For frequencies below 100 MHz, the following may be considered for SAR test exclusion (also illustrated in

Appendix C):

1) For test separation distances > 50 mm and < 200 mm, the power threshold at the corresponding test

separation distance at 100 MHz in step b) is multiplied by $[1 + \log(100/f$
(MHz)

)]

2) For test separation distances ≤ 50 mm, the power threshold determined by the equation in c) 1) for 50

mm and 100 MHz is multiplied by $\frac{1}{2}$

For operation below 100 MHz, paragraph c applies

When the transmitted signal is measured as a field strength value (dB μ V/m), this value is converted to a power

level using the following derivation:

Step 1 – Per ANSI C63.10:2013 section 10.3.9 equation (34), the relationship between EIRP and field strength

$$EIRP_{meas} = E_{meas} - 95.3$$

is as follows:

$$EIRP = E_{Meas} + 20 \log(d_{meas}) - 104.7$$

EIRP is the equivalent isotropically radiated power,

E_{Meas} in dBm is the field strength of the emission at the measurement distance, in dB μ V/m

d_{meas} is the measurement distance, in m

Field strength(dBuV/m)	EIRP(dBm)	(mW)	Frequency(MHz)	Min. distance(mm)	limit
72.46	-22.84	0.00519996	13.56	5	236.7

Simultaneous transmission calculation

BLE:0.36496+NFC:0.00519996=0.37015996 $\leq$ 3.0 for 1-g SAR, Separation distance is 5mm.

Conclusion: No SAR is required
