Bloodhound Tracking Device, Inc.  
Marco Maldonado  
309 Henrietta St  
Webster, TX 77598

Dear Marco Maldonado,

Enclosed is the Electromagnetic Compatibility for the Bloodhound Tracking Device, Inc., Instrumentation Unit, tested to the requirements of:

- FCC Part 15.247 (per ANSI C63.10: 2020)
- Innovation, Science, and Economic Development (ISED) Canada RSS-247 Issue 3

Thank you for using the services of Eurofins E&E Testing NA, LLC. Please contact me if you have any questions regarding these results or if Eurofins E&E can be of further service to you.

Sincerely,

Documentation Department

## 1.0 Testing Summary

The Bloodhound Tracking Device, Inc., Instrumentation Unit was found to be compliant to the following specification(s).

- FCC Part 15.247 (per ANSI C63.10: 2020)
- RSS-247 Issue 3

Chin Ming Lui  
Senior Wireless Test Engineer

**Engineering Statement:** The measurements shown in this report were made in accordance with the procedures indicated. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements.

David Trevayne-Smith  
Commercial Director-Wireless, California

## 2.0 Overview

Eurofins E&E Testing NA, LLC. was contracted by Bloodhound Tracking Device, Inc. to perform testing on the Instrumentation Unit, under purchase order number 0018.

This document describes the test setups, test methods, required test equipment, and the test limit criteria used to perform compliance testing of Bloodhound Tracking Device, Inc., Instrumentation Unit.

The results obtained relate only to the item(s) tested.

### **2.3 Modifications to the EUT**

No modifications were made to the EUT.

### **2.4 Modifications to the Standard**

No modifications were made to the Test Standard.

### **2.5 Disposition of EUT**

The test sample including all support equipment (if any), submitted to the Electromagnetic Compatibility Lab for testing was returned to Bloodhound Tracking Device, Inc. upon completion of testing.

### 3.0 Electromagnetic Compatibility Criteria for Intentional Radiators

#### 3.1 Antenna-Port Conducted Measurements

**Test Method:** ANSI C63.10: 2020; FCC KDB 558074 D01 15.247 Meas Guidance v05r02

**Test Requirements:** The following standards are covered under this test:

- FCC Part 15 Subpart C §15.247
- ISED RSS-247 Issue 3 §5.2, §5.4, §5.5

**Test Procedure:** The EUT was configured to operate in continuous transmission mode on LoRa channels using its lowest, middle, and highest frequencies (902.5 MHz, 908.7 MHz, and 914.9 MHz).

- Conducted measurements were performed at the antenna port of the EUT using a spectrum analyzer. Procedures for testing DTS devices operating in the 902 MHz to 928 MHz band per Section 11 of ANSI C63.10: 2020 were followed.
- The reference level was set based on the peak power of the fundamental channel.
- Emissions outside the 902-928 MHz band were measured and compared to the 20 dB attenuation requirement per FCC §15.247(d) and RSS-247 Section 5.5, using a resolution bandwidth (RBW) of 100 kHz and video bandwidth (VBW) of 300 kHz.
- Measurement traces were recorded for each tested channel.

### 3.2 Radiated Spurious Emissions

**Test Method:** ANSI C63.10: 2020; FCC KDB 558074 D01 15.247 Meas Guidance v05r02

**Test Requirement(s):** The following standards specified below are covered in the scope of this section of the test report:

- FCC Part 15 Subpart C §15.247
- RSS-247 Issue 3

**FCC – §15.209 Radiated emission limits; general requirements.**

**(a)** Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field Strength (dB $\mu$ V/m)	Measurement Distance (m)
30 - 88	40	3
88 - 216	43.5	3
216 - 960	46	3
Above 960	54	3

**ISED – Transmitter emission limits:**

Refer to RSS-Gen Issue 5 Section 8.9 Transmitter emission limits Table 5 – General field strength limits at frequencies above 30 MHz.

**FCC – §15.205 Restricted bands of operation.**

(a) Except as shown in paragraph (d) of this section, only spurious emissions are permitted in any of the frequency bands listed below:

MHz	MHz	MHz	GHz
0.090-0.110	16.42-16.423	399.9-410	4.5-5.15

13.36-13.41			

<sup>1</sup> Until February, 1999, this restricted band shall be 0.490-0.510 MHz.

<sup>2</sup> Above 38.6

**ISED – Restricted frequency bands:**

Refer to RSS-Gen Issue 5 Section 8.10 Restricted frequency bands Table 7 – Restricted frequency bands.

**Sample Calculation for Distance Correction factor (DCF) measurement:**

$F_d = 20 \cdot \log_{10} (D_m/D_s)$   
 where:  
 $F_d$  = Distance Factor in dB  
 $D_m$  = Measurement Distance in meters  
 $D_s$  = Specification Distance in meters

**Sample formula for calculating the Corrected Data for the Radiated Emissions Measurements:**

Frequency (MHz)	Antenna Polarity	EUT Azimuth (Degrees)	Antenna Height (cm)	Uncorrected Amplitude (dB $\mu$ V)	ACF (dB/m) (+)	Pre Amp Gain (dB)(-)	CBL (dB) (+)	DCF (dB) (+)	Corrected Amplitude (dB $\mu$ V/m)	Limit (dB $\mu$ V/m)	Margin (dB)
249.99	V	359.9	240.7	55.46	11.4	28.335	0	0	<b>38.505</b>	47	-8.495

$$\begin{aligned}
 \text{Corrected Amplitude (dB}\mu\text{V/m)} &= \text{Uncorrected Amplitude (dB}\mu\text{V)} + \text{ACF (dB/m)} - \text{Preamp Gain (dB)} + \text{CBL (dB)} + \text{DCF (dB)} \\
 &= 55.46 + 11.4 - 28.335 + 0 + 0 = \mathbf{38.505}
 \end{aligned}$$

**Test Procedure:**

The method of testing, test conditions, and test procedures of ANSI C63.10: 2020 were used in addition to FCC KDB 558074 D01 15.247 Meas Guidance v05r02. Any measured frequency that exhibits a margin of compliance that is less than 3 dB below the specification limit is marked. Eurofins E&E recommends that every emission measured, has at least a 3 dB margin to allow for deviations in the emission characteristics that may occur during the production process.

For emissions between 30 MHz and 1000 MHz, the EUT was placed on a non-metallic table, 80 cm above the ground plane inside a semi-anechoic chamber a biconilog antenna was located 3m from the EUT on an adjustable mast. A pre-scan was first performed to find prominent radiated emissions. For final emissions measurements at each frequency of interest, the EUT was rotated, and the antenna height was varied between 1 m and 4 m to maximize the emission. Measurements in both horizontal and vertical polarities were made and the data was recorded. Unless otherwise specified, measurements were made using a quasi-peak detector with a 120 kHz resolution bandwidth.

For emissions between 1 GHz and 18 GHz, a double ridged guide horn was located 3 m from the EUT on an adjustable mast. The EUT as placed on a non-metallic table 150 cm above the ground plane inside a semi-anechoic chamber. A pre-scan was performed and used to find prominent radiated emissions. For final emissions measurements at each frequency of interest, the EUT was rotated, and the antenna height was varied depending on the geometry of the EUT. To ensure maximized emissions, the horn antenna was positioned both vertically and horizontally. Unless otherwise specified, measurements were made using a peak and average detector with a 1 MHz resolution bandwidth.

For emission between 18 GHz and 26 GHz, a high frequency standard gain horn antenna was located 3 m from the EUT on an adjustable mast. The EUT as placed on a non-metallic table 150 cm above the ground plane inside a semi-anechoic chamber. A pre-scan was performed and used to find prominent radiated emissions. For final emissions measurements at each frequency of interest, the EUT was rotated, and the antenna height was varied depending on the geometry of the EUT. To ensure maximized emissions, the horn antenna was positioned both vertically and horizontally. Unless otherwise specified, measurements were made using a peak and average detector with a 1 MHz resolution bandwidth.

Due to the size of the EUT, pre-liminary measurements were performed with the EUT rotated on different axis (X, Y, Z). The worst-case data is presented in this report.

**Test Software Used:**

Nexio BAT-EMC was used to perform this test.
