

# A Network Configuration Method for a Single Router

## 1. Hardware Connectivity

Connect the router as shown in the figure. After the router is powered on, the system indicator light stays green. After a period of time, the indicator light flashes twice and the system starts successfully, and the indicator light becomes red and stays on.

POWER joggle :  
Connect the power adapter

The network cable can be inserted into any network port without distinction

WAN/LAN interface:

As a WAN port: connect to optical fiber broadband Modem (optical cat), ADSL broadband Modem (A cat), and cell broadband interface

As a LAN port: Connects devices that require wired connections, such as computers and set-top boxes

- 1 RESET (reset key) is used to restore the router to factory Settings

When powered on, press the RESET button on the back panel of the router

Press the button until the system indicator light flashes and release.

Note: After the factory reset, all configuration parameters of the router will be cleared and the router needs to be configured again.

- 2 WAN/LAN interface

**Supports blind port insertion. The router automatically identifies the type of network port connection, and the network cable can be inserted into any port without distinction.**

As a WAN port, it can be connected to an optical broadband modem (optical cat), ADSL broadband modem (A cat) or a cell broadband interface; as a LAN port, it can be connected to a computer, set-top box and other wired devices.

The corresponding indicator light is always on, indicating that the port is normally connected and the link is established; the indicator light is flashing, indicating that the port is sending and receiving data.

- 3 POWER (power interface) is used to connect the matching power adapter

## 2. To learn more, go to the TP-LINK website and download the detailed configuration guide for your model. The steps to set up the router on a computer are the same as those on a mobile phone

1

WeChat customer service solves your network problems anytime and anywhere

Scan the app to make routing management easier

Connect your phone to the router's wireless signal.

(The wireless name can be found on the label at the bottom of the router)

2

After the connection is successful, the phone will automatically jump to the management interface; if not, manually open the browser, enter "tplinkin" in the address bar, log in to the management interface, create the administrator password, and click "OK".

3

The router will automatically detect the Internet access mode, please set the Internet access parameters according to the actual situation.

4

Set the wireless name and password, click "OK", complete the setting. The router can surf the Internet normally.

\* If the wireless connection is disconnected, reconnect the network using a new wireless name and password.

After the setting is completed, check the status of the system indicator:

operative mode	job instruction
Green is always on	The configuration is complete
Red stays bright	The router is waiting for configuration or line reception

CAUTION: Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

CAUTION: This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

FCC Statement: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not properly used and shielded, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off, the user is encouraged to try to correct the interference by one of the following measures:

—Reorient or relocate the receiving antenna.  
—Increase the distance between the equipment and receiver.  
—Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.  
—Consult the dealer or an experienced radio/TV technician for help.

RF exposure compliance statement:  
This device has been evaluated and found to comply with the specific RF exposure requirement. This equipment should be installed and operated with minimum distance 20cm between the router and your body.
