### 2.3.2 MAGPy probe information

Magnetic Amplitude and Gradient Probe System of probe MAGPy-8H3D+E3D consists of eight isotropic H-field sub probes and one isotropic E-field sub probe that are all integrated inside the probe head with a flat tip. Each isotropic H-field sub probe comprises three concentric orthogonal loop coil sensors. The isotropic E-field sub probe is composed of three orthogonal sensors (x and y sensors are dipoles and the sensor measuring the z component is a monopole). In total, the MAGPy-8H3D+E3D V2.6 probe is thus composed of nine sub probes and 27 single sensors that measure in the time-domain. The flat-tip probe design brings the sensors closer to the tip.

The probe specifications are provided in Table 2.1.

## Total exposure

MPE-based total exposure ratio (Worst case):

H-field:

$$\text{Coil 1} + \text{Coil 2} = 0.0893 + 0.0842 = 0.1735 < 1$$

### 3.5.3 For portable exposure condition:

**Note:**

- (1). The portable test modes have covered the considerations of the mobile test, only record the test data of the portable conditions in this section.
- (2) Operating modes with client device (1 %, 50%, 99% battery status of client device) have been test, only show the data of worst case of 1% battery status of client device.
- (3) Test performed with all the radiating structures operating at maximum power at the same time.
- (4) H-field measurements are taken along all three axes the device from 0cm~20cm in 2cm minimum increment for each edge surface of the host/client pair. If the center of the probe sensing element is more than 5mm from the probe outer edge, the field strengths need to be estimated for the positions that are not reachable.
- (5) According to the requirements if KDB 680106 D01 v04, If the center of the probe sensing element is located more than 5mm from the probe outer surface, the field strengths need to be estimated through modeling for those positions that are not reachable. (The sensitive elements are located approximately 18.5 mm below the external surface specified in user manual of MAGPy-8H3D+E3D V2.6)
- (6) The actual 0cm field strengths need to be estimated for the positions that are not reachable via numerical calculation.
- (7) Use Biot-Savart formula theory to estimate the strength of the magnetic field that the measuring instrument cannot measure. According to Biot-Savart formula:

**Top & Bottom Side:**

$$B = \frac{\mu_0 * I * N * R^2}{2 * (R^2 + x^2)^{3/2}}$$

**Front, left, right & rear Side:**

$$B = \frac{\mu_0 * I * N}{2 * x}$$

**B(Unit:A/m):** means H-field value;

$\mu_0$  is space permeability;  $\mu_0=4\pi*10^{-7}$ ;

**I(Unit:A):** A current element passing through a radiated coil;

**R(Unit:m):** means the Radius of radiated coil, according to provided Antenna specification:

R=0.019m;

**Test Distance(Unit:m):** The distance from the sensing element of the probe to the edge of the device surface.

**x(Unit:m):** means the center of the coil to the sensing elements of the probe. ( $x=\text{test distance}+R$ )

**N:** Number of turns, according to providing “Antenna specification” files: N=12.

- (8) For validation purposes: If the value to show a 30% agreement between the mode and the probe measurements for the two closest points to the device surface, and with 2cm increments. Then this extrapolation method is reasonable.
