2 General Information

2.1 Test Location

Company:	Dongguan DN Testing Co., Ltd
Address:	No. 1, West Fourth Street, South Xingfa Road, Wusha Liwu, Chang'an Town, Dongguan City, Guangdong P.R.China
Test engineer:	Wayne Lin

2.2 General Description of EUT

Manufacturer:	Shenzhen Hongshuo Technology Co., Ltd
Address of Manufacturer:	6th Floor, Building B, Nanbiantou Science and Technology Park, No.1 Tianyang 2nd Road, Dongfang Community, Songgang Street, Bao'an District, Shenzhen City, Guangdong Province
EUT Description:	Dog training collar
Test Model No.:	LX-001
Additional Model(s):	/
Power Supply:	Input DC 5V; DC 3.7V from rechargeable lithium-ion battery
Chip Type:	300AS926441
Serial number:	PR2508190399R9049
Trade Mark:	/
Hardware Version:	V1.0
Software Version:	V1.0
Operation Frequency:	433MHz
Type of Modulation:	ASK
Sample Type:	Prototype production
Antenna Type:	<input type="checkbox"/> External, <input checked="" type="checkbox"/> Integrated
Antenna Ports	<input checked="" type="checkbox"/> Ant 1, <input type="checkbox"/> Ant 2, <input type="checkbox"/> Ant 3
Antenna Gain*:	<input checked="" type="checkbox"/> Provided by applicant -2.12dBi
RF Cable*:	<input checked="" type="checkbox"/> Provided by applicant 0.5dB(0.6~1GHz); 0.8dB(1.4~2GHz); 1.0dB(2.1~2.7GHz); 1.5dB(3~4GHz); 1.8dB(4.4~6GHz);
Remark:	*Since the above data and/or information is provided by the applicant relevant results or conclusions of this report are only made for these data and/or information, DNT is not responsible for the authenticity, integrity and results of the data and information and/or the validity of the conclusion.

2.3 Test Environment and Mode

Operating Environment:	
Temperature:	20~25.0 °C
Humidity:	45~56 % RH
Atmospheric Pressure:	101.0~101.30 KPa
Test mode:	
Transmitting mode:	Keep the EUT in transmitting mode with all kind of modulation and all kind of data rate.

2.4 Channel List

Channel	Frequency
1	433MHz

2.5 Power Setting of Test Software

Software Name	N/A
Frequency(MHz)	433
Setting	Default

2.6 Assistant equipment used for test

Code	Equipment	Manufacturer	Model No.	Equipment No.
1	Adapter	HUAWEI	HW-100225C00	NA

2.7 Description of Support Units

The EUT has been tested independent unit.

2.8 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

Lab A:

- FCC, USA

Designation Number: CN1348

- A2LA (Certificate No. 7050.01)

DONGGUAN DN TESTING CO., LTD.

- Innovation, Science and Economic Development Canada

DONGGUAN DN TESTING CO., LTD. EMC Laboratory has been recognized by ISED as an accredited testing laboratory. CAB identifier is CN0149.

IC#: 30755.

3 Test results and Measurement Data

3.1 Antenna requirements

Standard requirement:	47 CFR Part 15C Section 15.203 /247(c)
<p>An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of §§15.211, 15.213, 15.217, 15.219, 15.221, or §15.236. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with §15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.</p>	
<p>The antenna is welded on the main PCB and no consideration of replacement. The best case gain of the antenna is -2.12dBi.</p>	

3.2 20dB Occupied Bandwidth

Test Requirement:	47 CFR Part 15C Section 15.231
Test Method:	ANSI C63.10:2013 Section 7.8.7
Test Setup:	<p style="text-align: center;">Spectrum Analyzer</p> 
Instruments Used:	Refer to section 2.9 for details
Exploratory Test Mode:	Transmitting with all kind of modulations, data rates
Final Test Mode:	Through Pre-scan, find the worst case
Limit:	no wider than 0.25% of the center frequency
Test Results:	Pass

Test Data:

Test Frequency (MHz)	20dB Bandwidth (MHz)	Limit (MHz)	Result
433	0.1451	1.085	Pass

Dongguan DN Testing Co., Ltd.

E-mail: service@dn-testing.com

3.3 Duration time

Test Requirement:	47 CFR Part 15C Section 15.231
Test Setup:	
Instruments Used:	Refer to section 2.9 for details
Exploratory Test Mode:	Transmitting with all kind of modulations, data rates
Final Test Mode:	Through Pre-scan, find the worst case
Limit:	<ol style="list-style-type: none">(1) A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.(2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.(3) Periodic transmissions at regular predetermined intervals are not permitted. However, polling or supervision transmissions, including data, to determine system integrity of transmitters used in security or safety applications are allowed if the total duration of transmissions does not exceed more than two seconds per hour for each transmitter. There is no limit on the number of individual transmissions, provided the total transmission time does not exceed two seconds per hour.
Test procedure	<ol style="list-style-type: none">1. Connect EUT antenna terminal to the spectrum analyzer with RF cable.2. Spectrum analyzer setting parameters : RBW:1MHz,VBW:3MHz,Span:0Hz.3. Set the EUT transmit in normal use.4. Adjust sweep time on the spectrum analyzer to capture at least one period of the pulse train of the EUT.5. Allow trace to stabilize, use the marker-delta function to measure the on time and off time of the signal.6. Record the results in the test report.
Test Results:	Pass

Test Data

Test Frequency (MHz)	On Time	Limit (s)	Result
433	4.207	5	Pass

Test Graphs

3.4 Duty Cycle

Limit :N/A

Test Graphs

If the pulse train is nonperiodic or is periodic with a period that exceeds 100 ms, or as an alternative to step f), then:

- 1) Set the TRIGGER on the spectrum analyzer to capture the greatest amount of pulse “ON time” over 100 ms.
- 2) Find the 100 ms period that contains the maximum “on time”; this may require summing the duration of multiple pulses as described in step f2).
- 3) Determine the duty cycle by dividing the total maximum “ON time” by 100 ms
$$(T_{ON}/100 \text{ ms})$$

For EUT:

Since the single "On time" value is already greater than 100ms, the duty cycle is 100%.

$$20\log(\text{Duty cycle})=0$$

3.5 Field Strength

Test Requirement:	47 CFR Part 15C Section 15.231															
Test Method:	ANSI C63.10 :2013 Section 11.12															
Test Setup:																
Test Instruments:	Refer to section 2.9 for details															
Exploratory Test Mode:	Transmitting with all kind of modulations, data rates															
Final Test Mode:	Through Pre-scan, find the worst case															
Limit:	<table border="1"> <thead> <tr> <th>Fundamental frequency (MHz)</th> <th>Field strength of fundamental@3m (microvolts/meter)</th> </tr> </thead> <tbody> <tr> <td>40.66-40.70</td> <td>2,250</td> </tr> <tr> <td>70-130</td> <td>1,250</td> </tr> <tr> <td>130-174</td> <td>11,250 to 3,750</td> </tr> <tr> <td>174-260</td> <td>3,750</td> </tr> <tr> <td>260-470</td> <td>13,750 to 12,500</td> </tr> <tr> <td>Above 470</td> <td>12,500</td> </tr> </tbody> </table>		Fundamental frequency (MHz)	Field strength of fundamental@3m (microvolts/meter)	40.66-40.70	2,250	70-130	1,250	130-174	11,250 to 3,750	174-260	3,750	260-470	13,750 to 12,500	Above 470	12,500
Fundamental frequency (MHz)	Field strength of fundamental@3m (microvolts/meter)															
40.66-40.70	2,250

260-470	13,750 to 12,500															
Above 470	12,500															
¹ Linear interpolations The EUT fundamental frequency is 433MHz, So the Average Limit & Peak Limit is show in below table:																
<table border="1"> <thead> <tr> <th rowspan="2">Fundamental frequency (MHz)</th> <th colspan="2">Field strength of fundamental@3m (dBμV/m)</th> </tr> <tr> <th>Average Limit</th> <th>Peak Limit</th> </tr> </thead> <tbody> <tr> <td>433</td> <td>80.79</td> <td>100.79</td> </tr> </tbody> </table>			Fundamental frequency (MHz)	Field strength of fundamental@3m (dB μ V/m)		Average Limit	Peak Limit	433	80.79	100.79						
Fundamental frequency (MHz)	Field strength of fundamental@3m (dB μ V/m)															
	Average Limit	Peak Limit														
433	80.79	100.79														
Note: According to ANSI C63.10:2013 section 7.6.2: The effective limit at the frequency of interest is found by linearly interpolating using the familiar slope-intercept formula, $y = mx+b$, rewritten as in Equation:																

	<p>Limit[μV/m]=Limlower+ΔF[(Limupper-Limlower)/(fupper-flower)]</p> <p>where</p> <p>Limlower is the limit at the lower frequency of the intended band of operation</p> <p>Limupper is the limit at the upper frequency of the intended band of operation</p> <p>flower is the lower frequency of the intended band of operation</p> <p>fupper is the upper frequency of the intended band of operation</p> <p>ΔF equals f_c – flower</p> <p>f_c is the center frequency of the emission signal</p> <p>For fundamental frequency 433MHz:</p> <p>Average Limit(μV/m)=3750+(433-260)[(12500-3750)/(470-260)]=10958.33</p> <p>2. Average Limit(dBμV/m)=20×LOG[FieldStrength(μV/m)]=20×LOG(10958.33)=80.79</p> <p>According to §15.35(b): Peak Limit (dBμV/m)= Average Limit (dBμV/m)+20dB=80.79+20=100.79</p>
Test Configuration:	<p>RBW: \geqOBW</p> <p>VBW: 3XRBW</p> <p>Start frequency: 260MHz</p> <p>Stop frequency: 470MHz</p> <p>Sweep Time: Auto</p> <p>Detector: PEAK/AVG</p> <p>Trace Mode: Max Hold</p>
Test Procedure:	<ol style="list-style-type: none">the EUT was placed on the top of a rotating table 1 meters above the ground at a 3 meter semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiationThe EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.The antenna height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters(for the test frequency of below 30MHz, the antenna was tuned to heights 1 meter) and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.The radiation measurements are performed in X, Y, Z axis positioning for Transmitting mode, And found the X axis positioning which is worse case.Repeat above procedures until all frequencies measured was complete.
Test Results:	Pass

**Test Data**

Frequency (MHz)	20log (Duty cycle) (dB)	Peak Level (dB μ V/m)	Average Level (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)	Detector Type	Polarity
433	0	76.77	76.77	80.79	4.02	AVG	H
433	0	77.47	77.47	80.79	3.32	AVG	V

Horizontal:

NO.	Freq. [MHz]	Reading Level [dBμV]	Correct Factor [dB/m]	Result Level [dBμV/m]	Limit [dBμV/m]	Margin [dB]	Height [cm]	Angle [°]	Remark
1	432.99	80.02	-3.25	76.77	100.83	24.06	100	273	PK

Vertical:

NO.	Freq. [MHz]	Reading Level [dBμV]	Correct Factor [dB/m]	Result Level [dBμV/m]	Limit [dBμV/m]	Margin [dB]	Height [cm]	Angle [°]	Remark
1	433.03	80.71	-3.24	77.47	100.83	23.36	100	111	PK

Note

1. The Measurement (Result Level) is calculated by Reading Level adding the Correct Factor(maybe including LISN Factor and the Cable Factor etc.), The basic equation is as follows:

Result Level= Reading Level + Correct Factor(including Ant.Factor ,Cable Factor etc.)

2. Since the Peak value is below the limit set by AV, we conclude that AV also meets the limit requirements.

3.6 Radiated Spurious Emissions

Test Requirement:	47 CFR Part 15C Section 15.231 47 CFR Part 15C Section 15.209				
Test Method:	ANSI C63.10 :2013 Section 11.12				
Test Site:	Measurement Distance: 3m or 10m (Semi-Anechoic Chamber)				
Receiver Setup:	Frequency	Detector	RBW	VBW	Remark
	0.009MHz-0.090MHz	Peak	10kHz	30kHz	Peak
	0.009MHz-0.090MHz	Average	10kHz	30kHz	Average
	0.090MHz-0.110MHz	Quasi-peak	10kHz	30kHz	Quasi-peak
	0.110MHz-0.490MHz	Peak	10kHz	30kHz	Peak
	0.110MHz-0.490MHz	Average	10kHz	30kHz	Average
	0.490MHz -30MHz	Quasi-peak	10kHz	30kHz	Quasi-peak
	30MHz-1GHz	Quasi-peak	120kHz	300kHz	Quasi-peak
	Above 1GHz	Peak	1MHz	3MHz	Peak
Limit:	15.209 Radiated emission limits				
	Frequency	Field strength (microvolt/meter)	Limit (dBuV/m)	Remark	Measurement distance (m)
	0.009MHz-0.490MHz	2400/F(kHz)	-	-	300
	0.490MHz-1.705MHz	24000/F(kHz)	-	-	30
	1.705MHz-30MHz	30	-	-	30
	30MHz-88MHz	100	40.0	Quasi-peak	3
	88MHz-216MHz	150	43.5	Quasi-peak	3
	216MHz-960MHz	200	46.0	Quasi-peak	3
	960MHz-1GHz	500	54.0	Quasi-peak	3
	Above 1GHz	500	54.0	Average	3
	Remark: Unless otherwise specified, the limit on peak radio frequency emissions is 20dB above the maximum permitted average emission limit applicable to the equipment under test. This peak limit applies to the total peak emission level radiated by the device.				
	The limits on the field strength of the spurious emissions in the below table are based on the fundamental frequency of the intentional radiator. Spurious emissions shall be attenuated to the average (or, alternatively, CISPR quasi-peak) limits shown in this table or to the general limits shown in §15.209, whichever limit permits a higher field strength.				

Fundamental frequency (MHz)	Field strength of spurious emission@3m (microvolts/meter)
40.66-40.70	225
70-130	125
130-174	¹ 125 to 375
174-260	375
260-470	¹ 375 to 1,250
Above 470	1,250
¹ Linear interpolations	

The EUT fundamental frequency is 433MHz, So the Average Limit& Peak Limit is show in below table:

Fundamental frequency (MHz)	Field strength of spurious emission@3m (dBμV/m)	
	Average Limit	Peak Limit
433	60.79	80.79

Note:

According to ANSI C63.10:2013 section 7.6.2:

The effective limit at the frequency of interest is found by linearly interpolating using the familiarslope-intercept formula, $y = mx+b$, rewritten as in Equation:

$$\text{Limit}[\mu\text{V}/\text{m}] = \text{Limlower} + \Delta F [(\text{Limupper} - \text{Limlower}) / (\text{fupper} - \text{flower})]$$

where

Limlower is the limit at the lower frequency of the intended band of operation

Limupper is the limit at the upper frequency of the intended band of operation

f_{lower} is the lower frequency of the intended band of operation

f_{upper} is the upper frequency of the intended band of operation

ΔF equals $f_c - f_{lower}$

f_c is the center frequency of the emission signal

For fundamental frequency 433MHz:

$$\text{Average Limit}(\mu\text{V}/\text{m}) = 375 + (433 - 260) [(1250 - 375) / (470 - 260)] = 1095.833$$

$$\begin{aligned} 2. \text{AverageLimit}(\text{dB}\mu\text{V}/\text{m}) &= 20 \times \text{LOG}[\text{FieldStrength}(\mu\text{V}/\text{m})] = 20 \times \text{LOG}(1095.833) \\ &= 60.79 \end{aligned}$$

According to §15.35(b):

$$\text{Peak Limit} (\text{dB}\mu\text{V}/\text{m}) = \text{Average Limit} (\text{dB}\mu\text{V}/\text{m}) + 20\text{dB} = 60.79 + 20 = 80.79$$

Test Setup:

Figure 1. Below 30MHz

Figure 2. 30MHz to 1GHz

Figure 3. Above 1 GHz

Test Procedure:	<ul style="list-style-type: none"> h. For below 1GHz, the EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 or 10 meter semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation. i. For above 1GHz, the EUT was placed on the top of a rotating table 1.5 meters above the ground at a 3 meter semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation j. The EUT was set 3 or 10 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower. k. The antenna height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement. l. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters(for the test frequency of below 30MHz, the antenna was tuned to heights 1 meter) and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading. m. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode. n. If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet. o. Test the EUT in the lowest channel, the middle channel ,the Highest channel. p. The radiation measurements are performed in X, Y, Z axis positioning for Transmitting mode, And found the X axis positioning which it is worse case. q. Repeat above procedures until all frequencies measured was complete.
Exploratory Test Mode:	Transmitting with all kind of modulations, data rates. Charge + Transmitting mode.

Final Test Mode:	Pretest the EUT at Charge + Transmitting mode. Through Pre-scan, find the worst case.
Instruments Used:	Refer to section 2.9 for details
Test Results:	Pass

Test data
For 30-1000MHz TX

Note:

1. The Measurement (Result Level) is calculated by Reading Level adding the Correct Factor(maybe including Ant.Factor and the Cable Factor etc.), The basic equation is as follows:

Measurement Level= Reading Level + Correct Factor(including LISN Factor ,Cable Factor etc.)

2. The amplitude of 9KHz to 30MHz spurious emission that is attenuated by more than 20dB below the permissible limit has no need to be reported.

3.7 AC Power Line Conducted Emissions

Test Requirement:	47 CFR Part 15C Section 15.207															
Test Method:	ANSI C63.10: 2020															
Test Frequency Range:	150kHz to 30MHz															
Limit:	<table border="1"><thead><tr><th>Frequency range (MHz)</th><th colspan="2">Limit (dBuV)</th></tr><tr><th></th><th>Quasi-peak</th><th>Average</th></tr></thead><tbody><tr><td>0.15-0.5</td><td>66 to 56*</td><td>56 to 46*</td></tr><tr><td>0.5-5</td><td>56</td><td>46</td></tr><tr><td>5-30</td><td>60</td><td>50</td></tr></tbody></table>	Frequency range (MHz)	Limit (dBuV)			Quasi-peak	Average	0.15-0.5	66 to 56*	56 to 46*	0.5-5	56	46	5-30	60	50
Frequency range (MHz)	Limit (dBuV)															
	Quasi-peak	Average

0.5-5	56	46														
5-30	60	50														
	* Decreases with the logarithm of the frequency.															
Test Procedure:	<ol style="list-style-type: none">1) The mains terminal disturbance voltage test was conducted in a shielded room.2) The EUT was connected to AC power source through a LISN 1 (Line Impedance Stabilization Network) which provides a $50\Omega/50\mu\text{H} + 5\Omega$ linear impedance. The power cables of all other units of the EUT were connected to a second LISN 2, which was bonded to the ground reference plane in the same way as the LISN 1 for the unit being measured. A multiple socket outlet strip was used to connect multiple power cables to a single LISN provided the rating of the LISN was not exceeded.3) The tabletop EUT was placed upon a non-metallic table 0.8m above the ground reference plane. And for floor-standing arrangement, the EUT was placed on the horizontal ground reference plane,4) The test was performed with a vertical ground reference plane. The rear of the EUT shall be 0.4 m from the vertical ground reference plane. The vertical ground reference plane was bonded to the horizontal ground reference plane. The LISN 1 was placed 0.8 m from the boundary of the unit under test and bonded to a ground reference plane for LISNs mounted on top of the ground reference plane. This distance was between the closest points of the LISN 1 and the EUT. All other units of the EUT and associated equipment was at least 0.8 m from the LISN 2. In order to find the maximum emission, the relative positions of equipment and all of the interface cables must be changed according to ANSI C63.10 2013 on conducted measurement.															
Test Setup:																
Exploratory Test Mode:	Transmitting with all kind of modulations, data rates at lowest, middle and highest channel.															

	Charge + Transmitting mode.
Final Test Mode:	Through Pre-scan, find the 6.5Mbps of rate of 802.11n(HT20) at lowest channel is the worst case. Charge + Transmitting mode. Only the worst case is recorded in the report.
Instruments Used:	Refer to section 2.9 for details
Test Results:	PASS

Measurement Data

An initial pre-scan was performed on the live and neutral lines with peak detector. Quasi-Peak and Average measurement were performed at the frequencies with maximized peak emission were detected.

Live Line:

Final Data List
