### 4.3 Maximum Conducted Output Power

Test Requirement:	47 CFR 15.247(b)(3)
Test Limit:	Refer to 47 CFR 15.247(b)(3), For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.
Test Method:	ANSI C63.10-2013, section 11.9.1 KDB 558074 D01 15.247 Meas Guidance v05r02
Procedure:	<p>ANSI C63.10-2013, section 11.9.1 Maximum peak conducted output power</p> <p>Note:</p> <p>Per ANSI C63.10-2013, if there are two or more antennas, the conducted powers at Core 0, Core 1, ..., Core i were first measured separately, as shown in the section above (this product only have one antenna). The measured values were then summed in linear power units then converted back to dBm.</p> <p>Per ANSI C63.10-2013 Section 14.4.3.2.3, the directional gain is calculated using the following formula, where GN is the gain of the nth antenna and NANT, the total number of antennas used.</p> <p>For correlated unequal antenna gain</p> $\text{Directional gain} = 10 \times \log[(10G1/20 + 10G2/20 + \dots + 10GN/20)^2 / NANT] \text{ dBi}$ <p>For completely uncorrelated unequal antenna gain</p> $\text{Directional gain} = 10 \times \log[(10G1/10 + 10G2/10 + \dots + 10GN/10) / NANT] \text{ dBi}$ <p>Sample Multiple antennas Calculation: Core 0 + Core 1 + ... Core i. = MIMO/CDD (i is the number of antennas)</p> $(\#VALUE! \text{ mW} + \text{ mW}) = \#VALUE! \text{ mW} = \text{ dBm}$ <p>Sample e.i.r.p. Calculation:</p> $\text{e.i.r.p. (dBm)} = \text{Conducted Power (dBm)} + \text{Ant gain (dBi)}$
