

MPE Calculation

FCC ID: A7AR2500N

EUT Description: Total Station

Typical use distance: $d \geq 20$ cm

Power density limit for mobile devices at 2.4GHz: $S \leq 1$ mW/cm²

Remark: Average $\leq$ Peak, which means that calculating the power density applying Peak power is worst case. The worst case operation mode generating the highest power in each frequency range is taken for calculation.

Frequency range: 2402-2480 MHz (BT)

Maximum measured conducted power (Peak): $P_{\text{conducted}} = 1.21$ dBm = 1.33 mW

Antenna Gain: $G = 1$ dBi

Calculation: $P_{\text{radiated}} = P_{\text{conducted}} + G_{\text{linear}} = 1.21$ dBm + 1 dBi = 2.21 dBm = 1.66 mW

Power density $S = (P_{\text{radiated}}) / (4\pi \times d^2) = 1.66 / 5026 = 0.00033$ mW/cm² is below the limit, so pass.
