Subject: Re: Part 24 Akzo report

I have reviewed the revised test report. Below are a couple of questions and comments.

1. I cannot read the antenna gain charts- the resolution of the scanning is not very good. What is the maximum antenna gain? This info is needed, as the EIRP must be listed on the grant.
2. Section 6.4.3 states that "no detectable spurious emissions" could be measured, however, "Emission Levels" are listed in Section 6.4.4. These appear to be noise floor measurements. Is this the case? If so, it should be noted.
3. I suggest that you list the antenna gain in Section 6.3.4, and add it to the measured conducted output power, to obtain the EIRP value. This EIRP should then be listed on the chart under "Summary of Test Results" on page 3 of the report, as it will be listed on the grant.

Greg, Try this one - it's pdf. I might have sent the wp one before with the draft logo on it.
