

FCC & ISED DFS Test Report

FCC ID: ACJ-SC-CX700
IC:216A-SCCX700

Report Reference No..... : 24EFSS04089 03671
Date Sample(s) Received..... : 2024-04-22
Date of Tested : From 2024-04-22 to 2024-5-30
Date of issue..... : 2024-06-06
Testing Laboratory : DongGuan ShuoXin Electronic Technology Co., Ltd.
Address : Zone A, 1F, No. 6, XinGang Road YuanGang Street,
XinAn District, ChangAn Town, DongGuan City,
GuangDong, China

Applicant's name for FCC..... : Panasonic Corporation of North America
Address for FCC..... : Two Riverfront Plaza, 9th Floor, Newark, New
Jersey,07102-5490,United States
Applicant's name for IC : Panasonic Canada Inc.
Address for IC..... : 5770 Ambler Drive Mississauga ON L4W 2T3 Canada
Manufacturer : Panasonic Corporation

Equipment : Wireless Speaker System
Trade Mark : Technics
Model : SC-CX700P
Ratings : I/P: 120V~ 60Hz

Test Engineer:

Blue Qiu

Responsible Engineer :

Smile Wang

Authorized Signatory:

King Wang

TEST REPORT DECLARE

Applicant's name for FCC	:	Panasonic Corporation of North America
Address for FCC	:	Two Riverfront Plaza, 9th Floor, Newark, New Jersey, 07102-5490, United States
Applicant's name for IC	:	Panasonic Canada Inc.
Address for IC	:	5770 Ambler Drive Mississauga ON L4W 2T3 Canada
Equipment under Test	:	Wireless Speaker System
Model No	:	SC-CX700P
Trade Mark	:	Technics
Manufacturer	:	Panasonic Corporation
Address	:	1006, Oaza Kadoma, kadoma-shi, Osaka, 571-8501, Japan
Standard(s)	:	RSS-247 Issue 3, Aug. 2023 RSS-247 Section 6 FCC Part 15, Subpart E (Section 15.407) / FCC 06-96 FCC KDB 789033 D02 General U-NII Test Procedures New Rules v02r01 FCC KDB 905462 D02 UNII DFS Compliance Procedures New Rules v02 FCC KDB 905462 D03 UNII Clients Without Radar Detection New Rules v01r02

We Declare:

The equipment described above is tested by DongGuan ShuoXin Electronic Technology Co., Ltd(ATT). and in the configuration tested the equipment complied with the standards specified above. The test results are contained in this test report and DongGuan ShuoXin Electronic Technology Co., Ltd.(ATT) is assumed of full responsibility for the accuracy and completeness of these tests.

ATT is not responsible for the sampling stage, so the results only apply to the sample as received.

ATT's reports apply only to the specific samples tested under conditions. It is manufacture's responsibility to ensure that additional production units of this model are manufactured with the identical electrical and mechanical components. ATT shall have no liability for any declarations, inferences or generalizations drawn by the client or others from ATT issued reports.

1. EUT INFORMATION

1.1 EUT SPECIFICATION TABLE

Table 1: Specification of EUT

Equipment	Wireless Speaker System	
Brand Name	Technics	
Test Model	SC-CX700P	
Series Model	N/A	
Model Difference(s)	N/A	
Operationa Mode	Slave	
Operating Frequency Range	5250 MHz ~ 5350 MHz & 5470 MHz ~ 5725 MHz(for FCC) 5470 MHz~5600 MHz & 5650 MHz~5725 MHz(for ISM)	
Antenna informaton	Antenna Type: PCB Ant 1:TNPA8021-1 Ant 2:TNPA8020-1	Maximum Peak Gain: 0.1dBi(Ant 1) -0.83dBi(Ant 2)
Modulation	OFDM,OFDMA	

Note: This device was functioned as a

☐ Master ☒ Slave device without radar detection ☐ Slave device with radar detection

Note:

1. For a more detailed features description, please refer to the manufacturer's specifications or the user's manual.

2U-NII DFS RULE REQUIREMENTS

2.1 WORKING MODES AND REQUIRED TEST ITEMS

The manufacturer shall state whether the UUT is capable of operating as a Master and/or a Client. If the UUT is capable of operating in more than one operating mode then each operating mode shall be tested separately. See tables 3 and 4 for the applicability of DFS requirements for each of the operational modes.

Table 3: Applicability of DFS requirements prior to use a channel

Requirement	Operational Mode		
	Master	Client without radar detection	Client with radar detection
Non-Occupancy Period	✓	✓	✓
DFS Detection Threshold	✓	Not required	✓
Channel Availability Check Time	✓	Not required	Not required
Uniform Spreading	✓	Not required	Not required
U-NII Detection Bandwidth	✓	Not required	✓

Table 4: Applicability of DFS requirements during normal operation.

Requirement	Operational Mode		
	Master	Client without radar detection	Client with radar detection
DFS Detection Threshold	✓	Not required	✓
Channel Closing Transmission Time	✓	✓	✓
Channel Move Time	✓	✓	✓
U-NII Detection Bandwidth	✓	Not required	✓

2.2 TEST LIMITS AND RADAR SIGNAL PARAMETERS

DETECTION THRESHOLD VALUES

Table 5: DFS Detection Thresholds for Master Devices and Client Devices With Radar Detection.

Maximum Transmit Power	Value (See Notes 1 and 2)
e.i.r.p. $\geq$ 200 milliwatt	-64 dBm
e.i.r.p. $<$ 200 milliwatt and power spectral density $<$ 10 dBm/MHz	-62 dBm
e.i.r.p. $<$ 200 milliwatt that do not meet the power spectral density requirement	-64 dBm

Note 1: This is the level at the input of the receiver assuming a 0 dBi receive antenna.

Note 2: Throughout these test procedures an additional 1 dB has been added to the amplitude of the test transmission waveforms to account for variations in measurement equipment. This will ensure that the test signal is at or above the detection threshold level to trigger a DFS response.

Note3: e.i.r.p. is based on the highest antenna gain. For MIMO devices refer to KDB Publication 662911 D01.

Table 6: DFS Response Requirement Values

Parameter	Value
Non-occupancy period	Minimum 30 minutes
Channel Availability Check Time	60 seconds
Channel Move Time	10 seconds See Note 1.
Channel Closing Transmission Time	200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second period. See Notes 1 and 2.
U-NII Detection Bandwidth	Minimum 100% of the UNII 99% transmission power bandwidth. See Note 3.

Note 1: Channel Move Time and the Channel Closing Transmission Time should be performed with Radar Type 0. The measurement timing begins at the end of the Radar Type 0 burst.

Note 2: The Channel Closing Transmission Time is comprised of 200 milliseconds starting at the beginning of the Channel Move Time plus any additional intermittent control signals required to facilitate a Channel move (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.

Note 3: During the U-NII Detection Bandwidth detection test, radar type 0 should be used. For each frequency step the minimum percentage of detection is 90 percent. Measurements are performed with no data traffic.

PARAMETERS OF DFS TEST SIGNALS

Step intervals of 0.1 microsecond for Pulse Width, 1 microsecond for PRI, 1 MHz for chirp width and 1 for the number of pulses will be utilized for the random determination of specific test waveforms.

Table 7: Short Pulse Radar Test Waveforms.

Radar Type	Pulse Width (μsec)	PRI (μsec)	Number of Pulses	Minimum Percentage of Successful Detection	Minimum Number of Trials
0	1	1428	18	See Note 1	See Note 1
1	1	Test A: 15 unique PRI values randomly selected from the list of 23 PRI values in Table 5a	Roundup $\left\{ \left(\frac{1}{360} \right) \cdot \left(\frac{19 \cdot 10^6}{\text{PRI}_{\mu\text{sec}}} \right) \right\}$	60%	30
		Test B: 15 unique PRI values randomly selected within the range of 518-3066 μsec, with a minimum increment of 1 μsec, excluding PRI values selected in Test A			
2	1-5	150-230	23-29	60%	30
3	6-10	200-500	16-18	60%	30
4	11-20	200-500	12-16	60%	30
Aggregate (Radar Types 1-4)				80%	120
Note 1: Short Pulse Radar Type 0 should be used for the detection bandwidth test, channel move time, and channel closing time tests.					

A minimum of 30 unique waveforms are required for each of the Short Pulse Radar Types 2 through 4. If more than 30 waveforms are used for Short Pulse Radar Types 2 through 4, then each additional waveform must also be unique and not repeated from the previous waveforms. If more than 30 waveforms are used for Short Pulse Radar Type 1, then each additional waveform is generated with Test B and must also be unique and not repeated from the previous waveforms in Tests A or B.

Table 8: Long Pulse Radar Test Waveform

Radar Type	Pulse Width (μsec)	Chirp Width (MHz)	PRI (μsec)	Number of Pulses per Burst	Number of Bursts	Minimum Percentage of Successful Detection	Minimum Number of Trials
5	50-100	5-20	1000-2000	1-3	8-20	80%	30

The parameters for this waveform are randomly chosen (The center frequency for each of the 30 trials of the Bin 5 radar shall be randomly selected within 80% of the Occupied Bandwidth.) Thirty unique waveforms are required for the Long Pulse Radar Type waveforms. If more than 30 waveforms are used for the Long Pulse Radar Type waveforms, then each additional waveform must also be unique and not repeated from the previous waveforms.

Table 9: Frequency Hopping Radar Test Waveform

Radar Type	Pulse Width (μsec)	Chirp Width (MHz)	PRI (μsec)	Number of Pulses per Burst	Number of Bursts	Minimum Percentage of Successful Detection	Minimum Number of Trials
6	1	333	9	0.333	300	70%	30

3. TEST INSTRUMENTS

Table 10: Test Instruments List.

DESCRIPTION	MANUFACTURER	MODEL NO.	Serial No	Calibration Until
Spectrum analyzer	KEYSIGHT	N9010A	MY55150427	05/22/2025
Signal Generator	KEYSIGHT	N5182B	MY53052051	05/22/2025
POWER SPLITTER	Mini-Circuits	ZN3PD-622W-S+	N/A	N/A
POWER SPLITTER	Mini-Circuits	ZN3PD-622W-S+	N/A	N/A
Attenuator	MCL	BW-N20W5+	N/A	N/A
AP	Aerohive	AP230	N/A	N/A

Note:

- (1) Calibration interval of instruments listed above is one year.
- (2) Wi-Fi Router's FCC ID: WBV-AP230

4. DYNAMIC FREQUENCY SELECTION (DFS) TEST

4.1 DFS MEASUREMENT SYSTEM

Test Procedure

1. Master device and client device are set up by conduction method as the following configuration.
2. The client device is connected to notebook and to access a IP address on wireless connection with the master device.
3. Then the master device is connected to another notebook to access a IP address.
4. Finally, let the two IP addresses run traffic with each other through the Run flow software "Lan test" to reach 17% channel loading.

Setup

The hopping type 6 pulse parameters are fixed while the hopping sequence is based on the August 2005 NTIA Hopping Frequency List. The initial starting point randomized at run-time and each subsequent starting point is incremented by 475. Each frequency in the 100-length segment is compared to the boundaries of the EUT Detection Bandwidth and the software creates a hopping burst pattern in accordance with Section 7.4.1.3 Method #2 Simulated Frequency Hopping Radar Waveform Generating Subsystem of FCC 06-96. The frequency of the signal generator is incremented in 1 MHz steps from FL to FH for each successive trial. This incremental sequence is repeated as required to generate a minimum of 30 total trials and to maintain a uniform frequency distribution over the entire Detection Bandwidth.

The signal monitoring equipment consists of a spectrum analyzer set to display 8001 bins on the horizontal axis. The time-domain resolution is 2 msec / bin with a 16 second sweep time, meeting the 10 second short pulse reporting criteria. The aggregate ON time is calculated by multiplying the number of bins above a threshold during a particular observation period by the dwell time per bin, with the analyzer set to peak detection and max hold.

Should multiple RF ports be utilized for the Master and/or Slave devices (for example, for diversity or MIMO implementations), additional combiner/dividers are inserted between the Master Combiner/Divider and the pad connected to the Master Device (and/or between the Slave Combiner/Divider and the pad connected to the Slave Device). Additional pads are utilized such that there is one pad at each RF port on each EUT.

4.2 CALIBRATION OF DFS DETECTION THRESHOLD LEVEL

A 50 ohm load is connected in place of the spectrum analyzer, and the spectrum analyzer is connected in place of the master device and the signal generator is set to CW mode. The amplitude of the signal generator is adjusted to yield a level of -62 dBm as measured on the spectrum analyzer.

Without changing any of the instrument settings, the spectrum analyzer is reconnected to the Common port of the Spectrum Analyzer Combiner/Divider. Measure the amplitude and calculate the difference from -62 dBm. Adjust the Reference Level Offset of the spectrum analyzer to this difference.

The spectrum analyzer displays the level of the signal generator as received at the antenna ports of the Master Device. The interference detection threshold may be varied from the calibrated value of -62 dBm and the spectrum analyzer will still indicate the level as received by the Master Device.

Set the signal generator to produce a radar waveform, trigger a burst manually and measure the level on the spectrum analyzer. Readjust the amplitude of the signal generator as required so that the peak level of the waveform is at a displayed level equal to the required or desired interference detection threshold. Separate signal generator amplitude settings are determined as required for each radar type.

4.3 DEVIATION FROM TEST STANDARD

No deviation.

5. TEST RESULTS

5.1 SUMMARY OF TEST RESULT

Clause	Test Parameter	Test Mode and Channel	Remarks	Pass/Fail
15.407	DFS Detection Threshold	-	No Applicable	N/A
15.407	Channel Availability Check Time	-	Not Applicable	N/A
15.407	Channel Move Time	TX AX (HE20) Mode 5300 MHz	Applicable	Pass
		TX AX (HE40) Mode 5310 MHz		
		TX AX (HE80) Mode 5290 MHz		
15.407	Channel Closing Transmission Time	TX AX (HE20) Mode 5300 MHz	Applicable	Pass
		TX AX (HE40) Mode 5310 MHz		
		TX AX (HE80) Mode 5290 MHz		
15.407	Non- Occupancy Period	TX AX (HE20) Mode 5300 MHz	Applicable	Pass
		TX AX (HE40) Mode 5310 MHz		
		TX AX (HE80) Mode 5290 MHz		
15.407	Uniform Spreading	-	Not Applicable	N/A
15.407	U-NII Detection Bandwidth	-	Not Applicable	N/A

5.2 TEST MODE: DEVICE OPERATING IN MASTER MODE.

The EUT is slave equipment, it need a master device when testing.

Master with injection at the Master. (Radar Test Waveforms are injected into the Master)

5.3 DFS DETECTION THRESHOLD

Calibration:

The EUT is slave equipment and it with the lowest gain is 3 dBi.

For a detection threshold level of -64dBm and the master antenna gain is 3 dBi, required detection threshold is -61.00 dBm (= -64+3).

Note: Maximum Transmit Power is less than 200 milliwatt in this report, so detection threshold level is -62dBm.

Radar Signal 0

5.4 CHANNEL CLOSING TRANSMISSION AND CHANNEL MOVE TIME WLAN TRAFFIC

TX AC(VHT20) Mode

Radar signal 0

Time Index Info

T0 : 0.1235 S (Radar Injection Start)
T1 : 0.0000 S (Radar Injection Stop)
T2 : 0.2000 S (200msec Interval)
T3 : 0.8485 S (Channel Move Time)

Time Per Bin: 0.4999875

T2~T3 Bins Over Threshold:
= 41 Bins

Channel Move Time: 0.8484788 S

Channel Close Time: 0.0204995 S

Note: T0 denotes the Radar Injection Start.

T1 denotes the start of Channel Move Time upon the end of the last Radar burst.

T2 denotes the data transmission time of 200ms from T1.

T3 denotes the end of Channel Move Time.

TX AC(VHT40) Mode

Radar signal 0

Time Index Info

T0 : 0.1420 S	(Radar Injection Start)	Time Per Bin: 0.4999875	Channel Move Time: 0.7799805 S
T1 : 0.0000 S	(Radar Injection Stop)	T2~T3 Bins Over Threshold:	Channel Close Time: 0.0174996 S
T2 : 0.2000 S	(200msec Interval)	= 35 Bins	
T3 : 0.7800 S	(Channel Move Time)		

Note: T0 denotes the Radar Injection Start.
T1 denotes the start of Channel Move Time upon the end of the last Radar burst.
T2 denotes the data transmission time of 200ms from T1.
T3 denotes the end of Channel Move Time.

TX AC(VHT80) Mode

Radar signal 0

Note: T0 denotes the Radar Injection Start.
T1 denotes the start of Channel Move Time upon the end of the last Radar burst.
T2 denotes the data transmission time of 200ms from T1.
T3 denotes the end of Channel Move Time.

TX AX (HE20)Mode		
Item	Measured Value(s)	Limit(s)
Channel Move Time	0.8485	10
Channel Close Time	0.0205	200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second period

TX AX (HE40)Mode		
Item	Measured Value(s)	Limit(s)
Channel Move Time	0.7800	10
Channel Close Time	0.0175	200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second period

TX AX (HE80)Mode		
Item	Measured Value(s)	Limit(s)
Channel Move Time	0.5260	10
Channel Close Time	0.0030	200 milliseconds + an aggregate of 60 milliseconds over remaining 10 second period

5.5 NON- OCCUPANCY PERIOD

During the 30 minutes observation time, UUT did not make any transmissions on a channel after a radar signal was detected on that channel by either the Channel Availability Check or the In-Service Monitoring.

TX AX(HE20) Mode 5300 Non-Occupancy period

TX AX (HE40) Mode 5310 Non-Occupancy period

TX AX(HE80) Mode 5290 Non-Occupancy period
