

RF Exposure / MPE Calculation

No. : 12486442H
Applicant : Panasonic Corporation
Type of Equipment : Radio Module
Model No. : WW18A
FCC ID : ACJ9TGWL18A

Panasonic Corporation declares that Model: WW18A complies with FCC radiation exposure requirement specified in the FCC Rule 2.1091 (for mobile).

RF Exposure Calculations:

The following information provides the minimum separation distance for the highest gain antenna provided with the “WW18A” as calculated from (B) Limits for General Population / Uncontrolled Exposure of TABLE 1- LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE) of §1.1310 Radiofrequency radiation exposure limits.

[WWAN part]

This calculation is based on the highest EIRP possible from the system, considering maximum power and antenna gain, and considering a 1mW/cm² uncontrolled exposure limit. The Friis formula used was:

$$S = \frac{P \times G}{4 \times \pi \times r^2}$$

Where

$P =$ 251.19 mW (Maximum average output power)

☒ Time average was used for the above value in consideration of 6-minutes time-averaging

☐ Burst power average was used for the above value in consideration of worst condition.

$G =$ 1.306 Numerical Antenna gain; equal to 1.16dBi

$r =$ 20 cm (Separation distance)

Power Density Result $S = 0.06527 \text{ mW/cm}^2$

WW18A contains certified cellular module (FCC ID: ACJ9TGWL18A).

The Radio module and the Wireless module both transmit simultaneously in their respective bands. Compliance for simultaneous transmission are shown by the following calculations.

Reference:**[WLAN part]**

This calculation is based on the highest EIRP possible from the system, considering maximum power and antenna gain, and considering a 1mW/cm² uncontrolled exposure limit. The Friis formula used was:

$$S = \frac{P \times G}{4 \times \pi \times r^2}$$

Where

$P = 100.00$ mW (Maximum average output power)

☒ Time average was used for the above value in consideration of 6-minutes time-averaging

☐ Burst power average was used for the above value in consideration of worst condition.

$G = 1.660$ Numerical Antenna gain; equal to 2.2 dBi

$r = 20$ cm (Separation distance)

Power Density Result $S = 0.03302$ mW/cm²

Reference:**[Bluetooth part]**

This calculation is based on the highest EIRP possible from the system, considering maximum power and antenna gain, and considering a 1mW/cm² uncontrolled exposure limit. The Friis formula used was:

$$S = \frac{P \times G}{4 \times \pi \times r^2}$$

Where

$P = 8.91$ mW (Maximum average output power)

☒ Time average was used for the above value in consideration of 6-minutes time-averaging

☐ Burst power average was used for the above value in consideration of worst condition.

$G = 1.524$ Numerical Antenna gain; equal to 1.83 dBi

$r = 20$ cm (Separation distance)

Power Density Result $S = 0.00270$ mW/cm²

Therefore, if WWAN, WLAN and Bluetooth transmit simultaneously,

$$S = 0.06527 \text{ mW/cm}^2 + 0.03302 \text{ mW/cm}^2 + 0.00270 \text{ mW/cm}^2 \\ 0.10099 \text{ mW/cm}^2$$

Even taking into account the tolerance, this device can be satisfied with the limits.
