Subject: Review of Motorola Inc., FCC ID: ACQWPS870G

Hi, Timothy:

Thanks for your comment letter. I've uploaded new internal photos showing RF card, test report, schematics and RF report, please check them out. In addition, please check the statements below as answers of your questions on the comment letter.

Firstly, the General Instrument Corp. is the subsidiary of Motorola (Please check out their website: <http://www.gi.com>). That's why the Grantee code for this case is ACQ.

About the copper tape, it will be integrated into all production models. So neither class 1 nor 2 change test need to be performed.

Additionally, we've corrected the data on page 60 & 61. Please check it out.

As for the figure about the bandedge shown on page 60 & 61, we did do test for 2310-2390MHz and 2483.5-2500MHz and the biggest figures exactly appear on 2390 and 2483.5MHz. That's why we only listed these figures in the test report. For this test, we will list all results in the future.

Finally, this product has no antenna connector. It's only an integral antenna. We will improve our internal photo next time.

Thanks again for your help. Please contact me if any further problem.
