## 5.4 Occupied Bandwidth

<b>Test Requirement:</b>	FCC Part 15 C Section 15.215 (C)
<b>Test Method:</b>	ANSI C63.10: 2009
<b>Frequency Range:</b>	Operation within the band 13.110 – 14.010 MHz
<b>Requirements:</b>	Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§ 15.217 through 15.257 and in subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission is contained within the frequency band designated in the rule section under which the equipment is operated. The requirement to contain the 20 dB bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage. If frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within at least the central 80% of the permitted band in order to minimize the possibility of out-of-band operation.
<b>Method of Measurement:</b>	The useful radiated emission from the EUT was detected by the spectrum analyser with peak detector.
<b>Test Result:</b>	The unit does meet the FCC Part 15 C Section 15.215 requirements.

The graph as below: represents the emissions take for this device.
