

Item 1. Please submit a User Manual in accordance with 2.1033(c).

In response to the request for the users manual, the customer states the following: The RDR-4000 Radar is a system which will be installed in various commercial and military aircraft. The system installation description or process is contained in hundreds if not thousands of assembly drawings within various manuals, i.e. components, system, functional, maintenance, etc. Each of these manuals is subsets of deliverables that are incorporated into a product package for each customer depending on aircraft type. The installation of this system into an aircraft is the responsibility of the customer purchasing the product. As such, the customer typically incorporates all the assembly drawings into their own process from a whole aircraft assembly point of view. To accomplish the Radar installation, each customer trains their assemblers to their own process and steps for incorporating the product into the final aircraft assembly. There is no End Users Manual for this product, to send each and every assembly drawing and instruction for each aircraft type or even a typical would requires hundreds or thousands of pages and the cooperation of each customer regarding their process for installation.

In lieu of a users manual and in order to avoid excessive data upload to FCC, the first page of the installation manual is uploaded to provide evidence that such a document exists. Should this documents be required for FCC Review, please contact the manufacturer to obtain a copy.
